

Each mode opens different sets of tools and options

SCROLLING THROUGH

When making an app or a website, scrolling spaces is an aspect that needs to be taken care of. So, to add elements on a screen that appear when you scroll, all you need to do is expand the artboard downwards. When doing this, make sure that in the Property Inspector, the Scrolling option is set to vertical.

Once you have expanded the artboard, a dotted line will appear, with a slider along the left edge of the artboard. This line indicates the start

The blue dotted line is where the post-scroll space starts

of the space that will be visible after the scrolling action takes place. You can drag it to adjust its position, depending upon your project's need. If you want an object to stay put in its position on the screen when a user is scrolling the contents, select the object on the artboard and then check the Fix Position While Scrolling box in the Property Inspector.

If you want a group of objects, creating which will be explained later in this article, to be scrollable, you can do that too. To do this, select the object group and head over to the Property Inspector, where under the Transform section, you will have three options, denoted using . The first one is the scroll group option, which allows the application of the horizontal scroll effect. The second is the vertical scroll, which is self-explanatory, and the third is the horizontal and vertical combined scroll option. Click on the one that you want to apply and adjust the properties in the artboard to make it work according to your needs.

SHAPING THE IDEAS

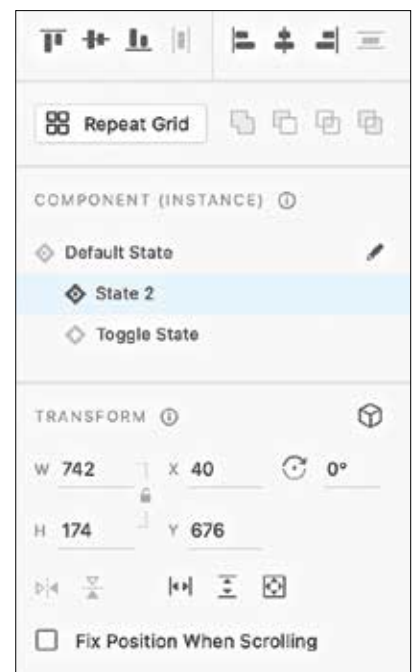

Once you have set up your artboard, the next step is to add elements to it, which can be done using the shapes and objects. When working with objects, you can perform an array of different operations, ranging from the basic shape and shadow transformations to adding 3D effects and transformations. Each type of object has different ways to be added.

To add a general geometric shape, you can select the relevant option from the left toolbar pane, where you will find options to add a square, circle, or triangle shape, along with the line and the pen tool. If you are adding an object like an image from a different application or one stored on your computer, go to the top menu bar of the application, locate the File option in the top menu bar of the window, and click on the Import option from the drop-down menu that opens. Select the object to be added, and voila, it will be there on your artboard.

Once the object is created/added to the artboard, you can transform or edit its properties as you want to. To do that, simply select the object by clicking on it and selecting the relevant option from the ones that appear on the Property Inspector, present on the right side of

the window. You can change the transparency and related properties using the Background Blur option present under the effects section and change the responsive resizing ability of the object by toggling on and off the option named Responsive Resize.

If you want the object to repeat multiple times in the artboard, select the object and click on the Repeat Grid option in the right-side menu. Drag the handle present on the left or the bottom side of the object to the distance you want to. This will create a grid with repeated objects. Here, you can do multiple collective actions such as adding and replacing text or images in the grid. In case you

The Property Inspector will be your buddy throughout

want to add a set of different images to a grid, simply select the images that you want to add to the grid, drag them into the artboard, and drop the images into the grid. If you want to perform a similar action with text inside the object, then create a return-separated .txt file with the text editor of your choice, making sure that the encoding is set to UTF-8. Now, select the grid, and drag and drop the file in there. The placeholder text in the grid will be replaced with the text that was there in the file.
