

After selecting the right mode, the most important step is to create a Home Screen, which is the starting point of interaction for the users. To set an artboard as the home screen, just mouse over to the artboard you would like to set as the Home Screen. Then locate the light grey home-shaped icon that appears on the top left corner of the artboard. Click on it, and it will be set as the home screen, and the change will be reflected when it changes to blue.

Now, with the home screen settings, you will have to start interlinking the different components. To link a component with another, such as an interactive activity that results in a change on the

Different flows created on an artboard

screen taking the user to the destination component, click on the component that you want to link to activate it. Next, click on the + icon on the highlighted border, and drag it to the destination component. This will create a flow, which, when initiated by the action of the user, will take them from the starting component to the destination component. If you want to change the type of interaction that triggers the component and the resulting chain of action, you can do that too. Just select the starting component and locate the Interaction menu section in the Property Inspector. There you will find multiple options to make the entire chain of actions suit your vision and needs.

TEST, FINE-TUNE, REPEAT

After the prototyping and linking of different components, you can also test the functionality of your project in XD using Desktop Preview. All you need to do is mouse over to the top right corner of the window and click on the play button. That will open a small window inside the app that will let you interact with different components to see if they

are functioning as you intended them to. If you want to record the functionalities that you are testing, click on the record button located in the top right corner of the window. Once your recording begins,

Desktop Preview window in XD

it will start blinking, indicating that all the actions in the window are being recorded. If you want to add voice notes or instructions to your recording, click on the downwards pointing arrowhead located next to the play button and turn on the Enable Microphone option.

SHARE, COLLABORATE AND EXPORT

Given the nature of work that takes place using Adobe XD, the developers have baked in different options to let the end-users share and collaborate on projects easily. As a user of XD, you can choose from an array of different, configurable sharing options, which can enable you not only to let your team members work on the project with you but also get the clients to review your work. All without them having to send them the entire project and guiding them through to how to open it in the first place, hence saving a lot of time.

Looking at the collaborative capabilities of the software first, there are two ways in which you can add collaborators to the project you are working on. The first is using the share document option, which is available throughout the app, irrespective of the mode that you are using. It appears in the top right corner of the window. When you click it, you will be presented with a pop-up, where you will be required to mention the email ID of the individual that you want to invite to work with you on the project. Just mention the email ID and an optional message if you want to and hit the blue-coloured Invite to edit button. The recipient will receive an email sent on your behalf by Adobe with a link for the recipient to get access to the project. From the same menu, you can also manage the collaborators that are

added to the project and remove the unnecessary ones.

If you are looking for a more customised set of options to share specific sections of your project or give limited functionality access to an outsider, you will have to switch to Share mode. From there, the Property Inspector will be populated with sharing options for you to choose from. You can choose from the different editing capabilities, which would change the way in which the person that you are adding to the project can have and also change the way in which they can access the document. Once you have selected the desired options, click on the Create Link button, and a link will be created for you

The sharing options in the application

to share. If you decide to change the permissions, you can just choose the newer settings and click on the Update Link button.

Once your project is finally complete, you will want to export the artboards. To do that, locate and click on the File option in the top menu bar of the application. In the drop-down menu go to the Export option and choose the number of artboards that you want to export. The window that opens will have different export options for you to choose from. Select the desired options and click on the blue Export button in the bottom right corner of the window. **d**
