

Tweet go brrrr

The first ever tweet reaches the NFT market place yet again as it goes up for sale for 48 mil USD <https://digit.in/apr22-41>

Zuck=Sauron?

Mark Zuckerberg reveals that Meta employees "lovingly" call him the eye of Sauron <https://digit.in/apr22-42>

specify the gateway. It can be either 192.168.1.1 or 192.168.1.2. Using the former will give you internet from one ISP whereas the latter will give you internet from the other ISP. Connecting any new device will automati-

cally default to the ISP connected to Gateway-1. That's all there is to it. You have now got two ISPs at home with two different routers but all the devices in your home, regardless of which gateway they're connected to,

can see each other and interact with each other. This method can be used to scale up to as many gateways or ISPs that you want. As long as there are enough open ports on your primary gateway. **d**

BUYING ADVICE

RENDERING ON A 5600G

Q Hello Agent001!

I am building my first PC with the configuration I want (with help from Digit). Need help with compatibility and checking if they bottleneck. Thanks a lot! :)

Main use case is animation and 3D modelling along with programming. Gaming is not the main purpose.

The Budget is around INR 75K.

Build

- CPU - AMD Ryzen 5 5600G -
- MOBO - GIGABYTE B450 AORUS PRO WiFi (need help) -
- GPU - Integrated graphics
- RAM - G Skill Ripjaws V 16 GB 3600 MHz (2x 8) -
- HDD - Already have a 4 TB drive
- SSD - WD Blue SN570 NVMe SSD 500 GB -
- PSU - Corsair CV450 - 450 Watt -
- Mouse - Logitech G102 Lightsync -
- Keyboard - TVS Electronics USB Gold Keyboard -
- Monitor - (not decided)
- Cabinet - (not decided)

Can you guys confirm if the build is suitable for the use case and if parts are fine according to budget?

I decided to buy the 5600G instead of a graphics card as according to your review, it has good Integrated Graphics and graphic cards can skew up the budget a lot. I decided to keep the build on Integrated Graphics and upgrade to a graphics card in future if the need arises. But if you guys think a graphics card will be a better option, please let me know.

I am most confused regarding what motherboard I should use. I need a basic motherboard with support for overclocking and preferably 4 RAM slots. Also, I would like to have Wi-Fi and Bluetooth. Should I get a card or get a USB dongle?

And can you suggest a suitable monitor and cabinet? Keeping in mind that the monitor is for graphic applications, Would an IPS panel work for this use case?

Thank you for taking time to read and helping me with the build of my first PC! Looking forward to hearing back from you!

—Adityan Singla

AMD Ryzen 5 5600G

Hey Adityan,

You've put together a pretty great build on your own. I've taken the liberty of tweaking a few components. There's a B450 AORUS PRO WIFI model available for 11.7K which will give you Wi-Fi and Bluetooth capabilities. I've also switched the SSD from a SN550 to an SN570 since that's newer and gives you much better performance for barely any extra cost. As for your question about using

this PC for animation and 3D modelling. Those are some compute-heavy tasks that require a lot of CPU and GPU power. However, there are ways around that. Blender is a great software for learning animation and 3D modelling. It's open-source and used widely across the industry. Since version 2.8, they've introduced a new rendering engine called Eevee or Extra Easy Virtual Environment Engine. It takes a lot of shortcuts during the rendering process to speed up rendering. There is a visual difference between objects rendered using the older engine (cycles) and the newer engine (Eevee) but the great thing is that you can use Eevee to quickly see what your render will look like during the process of building the model. Using this approach, you can start learning 3D modelling and animation right away and then upgrade to a discrete GPU when the prices normalise.

Your PC build comes down to 50K with the aforementioned components. Which leaves plenty of money for a nice monitor and chassis. Check out the Fractal Design Meshify-C, it's a great case for the price. This leaves about 20K for the monitor. The BenQ BL2420PT is a pretty good unit in that price bracket. It's a QHD monitor with an IPS panel that can reproduce 100% Rec.709 and 100% sRGB colour space. So you're getting plenty of work area thanks to the higher resolution and it's a colour accurate panel as well.

Graphics card prices are also normalising, so you might be able to get a decent card soon. Depending on the software that you're using at that point, the NVIDIA RTX 3060 or 3060 Ti are great cards for rendering and 3D modelling software and should be exactly what you need. **d**
