RDJ to Reboot Sherlock Holmes

Robert Downey Jr. will serve as executive producer for 2 Sherlock Holmes spin-off series on HBO Max. <https://digit.in/apr22-57>

the company, he was officially crowned the largest stakeholder, and was to join the board of directors for Twitter Inc. Twitter's CEO Parag Agarwal looked forward to Musk joining the board, but things changed last minute, as Musk himself declined to join the board. Agarwal has reassured that the company will always take the input of its stakeholders, and so Musk is always welcome to suggest changes with the way the site operates, which he did. The requests seemed confusing at best, where Musk asked for the premium subscription price to be reduced, removing advertising from the site entirely, and allowing users to pay in dogecoin. Seems like the head of Tesla,

SpaceX, NeuraLink and The Boring Company will keep the company count at 4 for now, because taking over the board of a company with this much of a personal stake is most certainly a Not.

BLIZZARD HIRING QA CONTRACTORS

The game development industry has always been a terrible place for worker rights, but that has taken a step for the better very recently. Blizzard Activision, having been embroiled in a lot of negative press for a poor workplace environment, female employee harassment by senior officials and laying off several thousand employees in the name of budget cuts has finally shown that worker unions can make a dent even in this crunch culture infused industry. With Raven Software unionising and Blizzard's own workforce staging a mass exodus, their hand was forced. Microsoft having recently acquired the company, decided to give 1,100 QAs and game testers official jobs. This includes having a stable pay, and being eligible for all the benefits that come associated with

being a Blizzard Activision employee. This is a great move and a sign that the game development industry is finally catching up on a long needed change to

respect its developers and not prey on their passion to develop video games for massive profits. A forced Hot, but a welcome one nonetheless.

ELDEN RING

The king of "Git Gud", FromSoftware is back at it again, with the release of the much anticipated title Elden Ring. For over a decade now, since the release of the first Dark Souls, the gaming community was thoroughly divided on whether this series of games should have an easy mode or not. The main principle of SoulsBorne games was to provide an insurmountable challenge which was to be beaten by consistent attempts and understanding the enemy's moves and design over dozens of deaths, maybe even hundreds. But all that changed with Elden Ring. The game features FromSoft's first open world, and this is not, for once, an attempt to pander to the AAA industry's incessant need to make every single game open world. The idea is to explore and tackle

challenges which you want to take on, rather than being forced on a linear path and learning at the pace the game wants you to learn at. Can't take on the two bosses up north? Explore the enemy camp down south for a new upgrade and then go back to tackle them with your newly procured powers.

This allows everyone to set their own pacing and difficulty levels. Where the hardcore SoulsBorne enthusiasts will stick with their guns of repeatedly banging their head at the next boss, and newcomers to the franchise will have the ability to explore and get stronger to tackle bosses and not feel instantly overwhelmed and underpowered. Using good game design to settle controversial debates on an entire genre of games? Hot indeed.

ASUS ZENBOOK FOLD 17

Asus has released yet another crazy piece of hardware, right alongside its flipping smartphone cameras and tablets with insanely powerful graphics cards. The Zenbook Fold 17 features a literal folding screen, which can be set up at a variety of different angles for different uses. Want to use it like a normal laptop? Fold it 90 degrees and place the wireless keyboard on one screen. Want

to use it like a tablet? Lay it flat for a glorious 17.3 inches of real estate. Feels like a whole TV in the palm of your hands. Your imagination is your only limit on how you wish to make use of this massive screen which folds and bends to your will. Boasting a 12th gen Intel chip, 16GB DDR5 RAM and a beefy 75W battery, this tablet/laptop/funky future tech is bound to be a conversation starter if not a great daily driver for a lot of users. The ability to switch between a tablet mode, laptop mode, and be able to fold it shut to consume less space makes it an ideal candidate for a variety of people. The only potential drawback is the hefty hit your wallet is going to take, priced at ₹3.30 Lacs. But hey, for that crazy functionality, it can ask for any sum it desires. Very Hot to see the laptop space still having room for innovation.
