Elon Musk continues to call out Vladimir Putin for a fight as he says he'll only use his left hand. <https://digit.in/apr22-59>

Apple iPhone (which gen?) and Mac Studio

SE – Special Edition? More like Su****r Edition

Boo-Man | boo@digit.in

Where do I even begin with the recent Apple Event? They launched their “new” phone, and a computer which does not even know where it fits on their own website! Regardless of what I write, team #PCMasterRace/Blue/Green/whatever they call themselves these days will be cheering me for booing Apple. Meanwhile, Team “but the ecosystem bro!” Jobs probably has emails primed and ready to trash every word I say. I don’t care; I’ve got a job to do, and the new launches aren’t exactly things that should be cheered, at least according to me. So, let’s dive into why I think so.

Starting with the iPhone SE. I have only one question. Why? From what I remember, Apple’s design is about half a decade old now. I get that it is cheaper to make a design that has been around for years, but at some point, you have to get over it. If the phone were a human, all the kids on the internet would have had a go at it, calling it a boomer and whatnot.

You know what? It should be called a boomer! One cannot wear the latest Jordans and talk about age-old practices, thinking they would still be considered cool. Well, the same pretty much applies to this phone. Apple gave it the latest chip and a slightly bigger battery

while keeping the rest of the phone practically the same as it was before. The screen is ancient and worse than phones that cost half as much money, and the bezels around it are just great. Great at showing the fans how old the phone is and how much it is not worth. Moreover, the new iPhone SE is more expensive than it was as well. It is \$30 more than its predecessor!

I would highly doubt your tech-savvyness if you consciously opt to purchase this phone. At ₹43,900, there are plenty of other phones out there that would give you a much

better experience. Many argue and liken the iPhone SE to a sleeper car, but it is far from it.

Now, about the Mac Studio. This is the literal definition of the sibling slayer. The way this product performs, it has already eaten into the market share of the Mac Pro, a.k.a., the cheese grater. If Apple wanted to launch such a powerful computer in the form of the Studio, then why tout the Mac Pro to be better when it clearly underperforms on some metrics (especially considering the price); most consumers won’t be able to afford either anyway.

The biggest thing that I would like to talk about is repairability and moddability. While Apple did

include an expandable SSD slot, it is just bait that they thought would slip under my radar. They have tied the pre-installed, ‘removable’ SSD to the firmware of the computer. That is like locking a person up in a transparent box and then asking them to compete in a race. To the world, it would look like the person is in the wrong for not running, while that poor person would stay locked in the confines of the seemingly absent walls. The same is the case with this SSD. Turns out, there is another SSD slot, but getting anything to work on it involves a convoluted process that just doesn’t make any sense to me.

Moving on, I cannot think of any reason why a company known

for its industrial designing of products would have an exposed power supply right over the SSD slot. They will shock you to death and say that it was your mistake. The marketing material would say that Apple is in favour

of the right to repair program, the cost that the consumer would have to bear would be that of their life though. And, again to the red eyed fan of the brand and the “eco-system”, I have nothing against you, but do not come running to me when you are fried to a crisp while installing an SSD in the supremely ‘expandable’ computer that Apple carefully put together for you.

If in the worst of my nightmares, I find myself lined up outside an Apple store to buy either of these products, I would choose to stay asleep and stay in that nightmare, because I will never be able to bear the burden that this life decision would put on me.
