purpose grapple claw, a smokescreen device, nitromethane afterburner, and the list goes on!

II) BATCOMPUTER

The Batcomputer- also referred to as the Bat-Wave in the TV series, is a supercomputer Batman originally developed to create an electronic data of criminal profiles. Over the years, it grew in size, from a medium sized monitor and keyboard, to multiple large monitors and keyboards, as well as in numbers, with one being present at the Batcave, Wayne Enterprises, as well as Arkham Asylum, in addition to others. Furthermore, the Batcomputer, along with being an electronic filing system, also grew in terms of capabilities over the years. It had a micro transmitter capable of transmitting on as well as tracking any frequency, it was capable of surpassing government and military firewall systems and hacking the same to access their databases, a

connection to television broadcasts all over the world to keep track of news of any criminal activity in real time, analysing bullet casings, tracing signal relays, testing DNA samples, and even went so far as being capable of placing the Arkham Asylum on lockdown!

III) BATARANG

Perhaps the most recognized, and quintessential piece of Bat-tech, Batman uses Batarangs over guns owing to his strong dislike for firearms following

his parents' death. The Gotham city vigilante developed many different variations of the Batarang simultaneously, each with a different purpose. Some had explosive charges in them, some were electrified. Some others were capable of freezing people and objects they came in contact with, and a few others served as a grappling hook for ropes. Batman also developed smoke grenade Batarangs to create distractions, magnetic batarangs used to disarm enemies, seeing-eye Batarangs for surveillance, and even a flashbulb

Batarang to illuminate dark spots. The small, Shuriken-like bat-shaped weapon therefore, is perhaps his most versatile gadget, and for its ease of use, perhaps the best!

IV) BATPLANE

People often think of Batman's sole mode of transport being the Batmobile. But did you know he had an airplane too? A billionaire without an airplane? No way! The Batplane though, was no ordinary aircraft, and was capable of a little more than a quick jaunt to the Bahamas. It could be summoned to drop the Batsuit anywhere as per Bruce Wayne's convenience. In addition to having a grapple cable, it had a number of other neat tricks up its sleeve- it was capable of converting into a helicopter, or even a submarine, it could create a vacuum blanket which helped disrupt the controls of enemy aircraft in its vicinity, and had a radio frequency scrambler as well. The Batplane also had infrared spotlights, aerial reconnaissance capabilities, a television,

radar screens, three way interchangeable landing gear, human ejector tubes for emergency evacuation, Batman's all-famous crime lab, and more! Capable of jet propulsion via auxiliary motors, the batplane could achieve a maximum speed of 4,400 miles per hour while cruising at 60,000 feet, with a maximum payload of 2,670 lb.

V) HELLBAT ARMOUR

We saved the best for last, obviously. The Hellbat Armour. Sure, Batman is loved for being the superhero with no superpowers of his own, and is perhaps why he is so respected. However, necessity being the mother of invention, forced Wayne to develop the Hellbat armour, which provides him enhanced strength and endurance to enable him to fight enemies he may otherwise have not been able to defeat. The armour is composed of a shifting nano-kinetic metallic composition which can be worn on command via voice activated

command to his computer A.I. system, and also has an inbuilt cloaking feature to give him invisibility. Furthermore, its cape transforms into wings for flight. The suit also has the ability to transfer all its power to the chest insignia, which could then be used to send out a powerful blast of energy. The suit can also change shape and semblance on its own, and has the ability to bash and fling enemies around even without a wearer, as well as use them as shields for defence.

The only disadvantage however, is that the suit can drain Batman's metabolism and may kill him with prolonged usage. Therefore, to help tackle the same, Wayne also designed a feature which allows him to selectively eject different parts of the suit to prolong his life. **[1]**
