

Ayaneo Next

While the Steam Deck has been getting all the headlines in the handheld console news of late, there have been other smaller companies striving to enter the same space with versions of their own. Ayaneo is one such company that has come out with the Next, a Windows-based handheld console that is touted to play AAA games on the go. If that weren't a bold statement already, Ayaneo also claims that Next has some features that are never before seen on a gaming handheld. Those features include hall sensor joysticks

and triggers that promise no drift, no dead zones, is high precision and more longevity over traditional joysticks and trigger mechanisms. In terms of internals, the Next has the AMD Ryzen 7 Zen 3 and even the base model comes with 1TB of storage. Compare that to the base model of the Steam Deck which has just 64GB of storage and the benefits of the Ayaneo Next is obvious. It is available in 5 colour options and also has quite a compact form factor making it look more like the Nintendo Switch. All that comes at a price though. The base model comes in at a cool \$1335 and can go all the way up to \$1535 and can be pre-ordered from Indiegogo.

DJI Matrice 30 Series

DJi has been comfortably leading the consumer drone market for a while now and most of the commercial market as well. They recently announced their new line of drones called the Matrice 30 series and boy, do they pack a punch. The M30 and M30T are the two drones that DJI has launched and what makes them stand out among the plethora of drones that DJI makes, is the fact that these are for Enterprise use and these drones can be used even in heavy rains. In fact, the announcement clearly states that the Drones are ready for "heavy rain, high winds, high altitudes and even in icy and snowy conditions from -20° C to 50° C". The drones also have foldable, self-locking arms that make them compact enough to be fit into a large backpack. In terms of the camera of the drone, the M30 has a 48MP ½" CMOS sensor with 5x and 16x optical zoom functionality and 200x digital zooming capability. It can shoot 8K photos and video at a resolution of 4K at 30 frames per second. While we could keep droning on about the features of the new drones, one thing to consider is the price, which pretty much puts it out of reach for most drone hobbyists. The M30 starts at \$10,000 and while the M30T starts at an even more exorbitant \$14,000. You do get a whole lot of drone for that price and might be a worthy addition to professionals but that still doesn't stop us from drooling over it!

Prodrive Hunter T1

When the first customer of this car is the crown prince of Bahrain and costs £1.25 million, you know for a fact that there is something very special about it. Well, that probably explains why the chairman of Prodrive, David Richards, hailed it as "the Ferrari of the desert". Contrary to what it might look like in pictures, this car is actually a road car and not some custom-built machine designed to munch the desert dunes which by the way it can also do. So basically, this car is designed to be the fastest cross country production car in the world. Kind of like a Dakar rally car but with some modifications to make it road legal and with some added comfort features. The road-going version has the same spaceframe tubular steel chassis as the Dakar rally car, has 17-inch wheels and 38-inch tyres for immense grip on the loosest of surfaces and as you might expect from a rally derived car, it has ultra-long travel

suspension as well. Moving on to the heart of the car, the T1 has a 3.5-litre twin-turbocharged engine, producing 600hp and a whopping 700Nm of torque which is capable of taking this monstrous machine up to 300kph. Sign us up for one of these please Prodrive (at a discount of course).
