

Sulla: The Full Sized Robot Powered by Machine Learning

Remember Irona the robot help from Richie Rich? Or Rosie the robot from The Jetsons? As out of this world and crazy as it seemed, to have a robot who would be do all the household chores, it seems to be getting close to reality with Sulla. Coming in at over 4-feet tall, Sulla is perfectly sized to perform practical and useful tasks around the house. It can also map the room it is in automatically and can save the map for future use. Sulla uses A.I.M.L (Artificial Intelligence Markup Language) which not only makes it capable of

carrying out conversations, but it can also learn new things about the owner by asking questions. One of the most important things about Sulla though is that the robot's software is open source. That means developers can improve and add abilities to the software making it evolve and become more useful as more developers get on board. In terms of the technical specifications, Sulla has an Nvidia Maxwell GPU, a Quad-Core ARM Cortex-A57 MPCore Processor, 4GB -64-bit DDR4 and 1TB SSD which provides the processing for the robot. It also has a depth camera, forward-facing LiDAR, accelerometer, two microphones among other gizmos.

Snoppa Rover Electric Stabilisation Cinema Dolly

Film making and video content creation is the easiest now than it has ever been before. People can now shoot outstanding content right from their smartphone with better performance and resolution than real cinema cameras from maybe 30 years ago. We also have all the gimbals, drones and other accessories that make filmmaking so easy today. There is, however, one device listed on Kickstarter at the moment that could make filming even easier. It's a combination of a tripod and gimbal that can be controlled like a drone via a remote and is called the Snoppa Rover Electric Stabilisation Cinema Dolly. It features wheels on each of its three arms. The wheels are powered and have steering control as well. An active dampening system between the wheels and stabilisation arms allow the Rover to traverse tough terrain while still stabilising that camera mounted on it. It also has a host of other features like the ability to climb slopes of up to 30 degrees, customised path planning, hyperlapse mode and smart subject tracking. If the Snoppa Rover ends up being as good as advertised, it's definitely going to be a device filmmakers are going to be clamouring to get their hands on it.

Triumph Tiger Sport 660

The Tiger range from Triumph Motorcycles is known for its huge proportions, massive engine and an equally jaw-dropping price tag. But for most the Tiger range is out of consideration because of its unruly size. After all, not all of us are built like Arnold Schwarzenegger. With this new Tiger Sport 660 though things might be a bit different, with a size that is much more compact, an engine that is smaller and a price tag that although it can't be called affordable, is not in the realms of ludicrousness. The Tiger Sport 660 is based on the Trident 660 street bike, with modified ergonomics to make it touring friendly. That means comfort is given a higher priority. The bike uses the same 660cc power mill seen on the Trident and delivers 81hp along with 64Nm of torque. The engine is also mated to

a six-speed gearbox. Since this bike is aimed at the touring audience, it has been given suspension with longer travel giving it a travel of 150mm. At the time of writing this, the bike has not been launched but it will be launched by the end of March and we expect it to be priced at approximately ₹9.5lacs.
