

Alogic 32W Rapid Power

So, the weird trend of not having the charger included with smartphones is in full swing. But it has had a happy side effect. Now we can actually look around and buy charging bricks from brands other than the make of your smartphone and more often than not, these third party chargers offer more than what you used to get in the box.

One of those devices arrived at the Digit Test Centre and we have been testing it out with one of the latest smartphones, which also happens to be reviewed in this issue. But before we get into the nitty-gritty of the test, let us tell you about what comes in the box and what the charging brick is like.

What you get in the box is just the charging brick and a Quick Start guide. The device we got had the model number WCG2X32-IND and it is also pretty compact. It has a matte white finish all over it and seems quite dense when held. On one end it has a standard two-pin Indian plug

and the other side has two USB ports for charging along with a tiny pilot light. The two ports that are available on this unit are USB-A and USB-C. The USB-C is compatible with Power Delivery charging protocols and has a power output of 20-30 Watts. The USB-A port on the other hand has power output figures of 20-30 Watts. One thing to note though is that when devices are connected to both ports, the USB-C will have a max power

output of 20 Watts and the USB-A will have a max output of 12 Watts which gives the Alogic 32W Rapid Power charging brick a total power output of... 32 Watts. Surprise! The charger also has a GaN chipset which basically generates less heat while in use than traditional charging technologies.

We tested the device with the Samsung Galaxy S22+ to get an idea of what using this charger would be like with modern flagship phones with fast charging tech.

With the phone turned off, the Alogic charger managed to charge the S22+ from 0 to 30 percent in 40 minutes and 50 percent in an hour and 6 minutes. This was using the USB-A port. But with the phone switched on you can choose to charge using fast charging protocols which the phone prompts you about. For our next run, we used the USB-C port and the charger managed to charge the phone from 10 percent to 100 percent in 1 hour and 28 minutes.

Dyson V12 Detect Slim

Dyson recently introduced its latest V12 Detect Slim cord-free vacuum cleaner in India that's priced a little above the last generation V11

Absolute Pro flagship and is positioned as the company's most intelligent compact vacuum cleaner. With the new iteration, Dyson focuses on making the cleaner easier to operate and adds a few exciting innovations like a laser sensor to detect fine dirt particles and a piezo sensor that analyses and counts the dust particles as they are being pulled in real-time. In India, the V12 Detect Slim has an MRP of ₹58,900 and it's available for ₹55,900 on Dyson's official website. The focus of this generation has been on making the v12 handier. It is noticeably slimmer and lighter than the last-gen. The main cleaner body is still shaped like a Sci-Fi blaster but the trigger has been replaced by a one-touch button, which is more convenient. There is a round LCD display on the back with a lone button to switch performance modes. The bin has a

0.35 L capacity and you can conveniently eject the collected dust using a clip at the bottom. The cleaner also has a sealed 5-layer filtration system to capture dust particles before the air is expelled from the rear. Suction power is what must be high on your priority list while buying a vacuum cleaner. The Dyson Vacuum cleaner has

evolved to be slimmer and more manageable. And yes, these refinements do come at the expense of some suction power – but thankfully, not much has been compromised. The Hyperdymium motor on the V12 Detect Slim has 11 'Root Cyclone' chambers as compared to the 14 chambers in the V11 Absolute Pro, but these 11 manage 150 air watts of suction power which is significantly higher than what you'd get on most conventional vacuum cleaners. The Dyson V12 Slim Detect is a versatile tool that can be used for targeted and intense cleaning across your home and will be relatively more reliable when it comes to intense cleaning performance.
