

The BenQ X3000i 4K home entertainment and gaming projector was recently launched in India. We caught up with Rajeev Singh, MD, BenQ India to talk about the company's latest 4K projector that also offers a big-screen gaming experience. The X3000i is a 4K HDR projector that features a quad-LED lamp, 240Hz refresh rate, 4.16ms low input lag, 3000 lumens brightness, Android TV and a host of connectivity options.

d We wanted to understand how has the COVID-19 pandemic impacted home entertainment and how has the consumer adapted to it these past two years?

With all the multiplexes getting locked down, the OTT platforms picked up. At first, people enjoyed these things on a mobile phone screen. You have now matches coming on the OTT platforms, so there was a need of viewing this on a larger than life screen. And that is where the projector use at home has really picked up during the last two years. Projectors have gone into your living room with a different kind of form factor which is what we call a laser TV where you can watch 100 inches, 120 inches 4K projection with all the lights on and then on the other side, the smart portable projectors, which you can use anywhere as you don't need a specific screen for that and you can project on any surface in any room. You can also carry it outside with you when you're travelling out.

So, all these trends, which were visible even before COVID, they've really gained momentum during this period because getting entertained at home became a really big thing and the content availability and content delivery were timed rightly.

d Tell us about some of the features that you think make the X3000i a unique offering?

The X3000i projector is uniquely designed to be used for home entertainment and gaming at an excellent level. The top-spec of home entertainment that you would expect in a projector and the top-spec of a gaming projector both are there in this projector. So it's a very unique combination where you can, whether it is watching the movies or playing games, both are enhanced on this projector.

So, while for the movie and video experience, it is a 4LED which is a new technology and this is the first world's 1st 4K 4LED projector with a high brightness level of 3000 lumen and DCI-P3 colour space coverage, that's the main thing. DCI-P3 is

the professional movie cinema colour space, so it covers that which is right at the top of the projection technology right now in terms of the kind of colours that it can reproduce. On the other side, you have 240Hz and 4ms response time, so it again is at the top in terms of the gaming experience with the low latency.

It is also very compact in the size. It does not look like a conventional projector. So you can use it anywhere at home, you can even put it on the on a sidewall and it can project on the sidewall so it has got a lot of flexibility.

d Can you elaborate on the four LED light source and how is it different from the three LED used in other projectors?

It uses the RGBB colour which gives a much brighter image as well as covers the entire DCI P3 colour spectrum. So, that is where there are certain colour shades of blue, primarily those that need to be enhanced. So, we have used the LED light source in the right proportion to be able to give complete DCI-P3 coverage which is right at the epitome of the colour space coverage as of now.

So one is that it is able to give that kind of colour space coverage. Generally, when you get this kind of colour space coverage, it comes at the cost of brightness. So the brightness with these kinds of projectors is normally lower, it's generally about 2000 lu-

men or below. Because the moment you go higher, you are not able to get this kind of colour space with this technology, which is what we have made possible for the first time for the industry. You get the high brightness and LED brightness of 3000 lumens is anyway higher than the 3000-lumen brightness of a conventional lamp. So it is brighter than a 3000-lumen conventional lamp, it has got a 500,000:1 contrast ratio so very high contrast which means very good reproduction of black and grey colours along with this kind of brightness levels. You can use this projector even in your living room without really dimming the lights and still you will get a very good quality picture.

d So one of the things gamers especially are concerned about is the input lag when using the projector. What are we like looking here for smooth gaming performance?

So one is the refresh rate that is right up to 240Hz and then the response time of 4 milliseconds. Of course, technology in future will be very different, but in today's world, this is the best possible. So it is right at the top of what best you can get in any gaming projector in the world has been given here right now. **d**
