Oppo Enco Air2 Struggles to stand out

The Oppo Enco Air2 is the company's latest entry-level TWS pair of earphones complete with 13.4mm drivers, Bluetooth 5.2 connectivity, touch controls and HeyMelody app support. The device is priced competitively at ₹2,499, but it does face its fair share of competitors. Read through as we put Oppo's entry-level TWS to the test to know if these earbuds are worth your money or if you should look elsewhere.

BUILD AND COMFORT

The Oppo Enco Air2 sports the half in-ear design that Apple popularised with its AirPods lineup. In fact, the earbuds look eerily similar to the older AirPods. The case, on the other hand, does stand out with its half-translucent design. The case is also extremely sleek and compact. Circling back to the earbuds, while they may not be anything special to look at, these earbuds are incredibly lightweight. The earbuds have a half in-ear design so you don't get silicone eartips. So despite their light weight, some users may not get an adequate fit, especially if they have smaller ears. The half in-ear design also hampers passive isolation, so you can hear your surroundings pretty easily if you don't listen to music at ridiculously loud levels.

FEATURES

The new Oppo Enco Air2 come with a decent number of features, but they do get bested in this department by the Realme Buds Q2 and DIZO Buds Z Pro.

What the Oppo Enco Air2 does have though is excellent app support. The HeyMelody app allows users to access multiple features such as Game Mode, EQ presets, and earbud controls. EQ presets, which OPPO has dubbed as Enco Live sound effects, include Original sound, Bass Boost and Clear vocals. The app also allows users to customise earbud controls including

the double tap, triple tap and touch and hold commands. There's also toggle for Game Mode within the app that reduces the latency down to 80ms, according to the company. In our testing, there was a slight difference in latency when Game Mode was turned on. However, app support is not available for iOS users.

The earphones also have other features such as IPX4 sweat and splash resistance on the earbuds and mono earbud usage. The earphones are powered by Bluetooth v5.2 which stable connectivity for the most part. Some Oppo phone models support additional features such as double tap to click a photo and Flash Connect (similar to Google Fast Pair). Overall, these earbuds are pretty feature-rich but the Realme Buds Q2 and the DIZO Buds Z Pro definitely beat them out in this regard with ANC and Transparency Mode support as well.

PERFORMANCE

Sporting 13.4mm composite titanized diaphragm drivers, the Oppo Enco Air2 produces loud sound with decent bass and mids. They're overemphasised, but that's necessary with half in-ear buds since they don't have a snug fit. The resulting sound is pretty warm and thumpy, although we wish that the highs were a bit more bal-

anced. The highs can sound slightly muffled in the mix at times since they are underemphasised in the mix. So, genres such as rock and classic don't sound as detailed. However, for most modern-day music, the Oppo Enco Air2 produces serviceable sound.

The Oppo Enco Air2 comes with AI Noise Cancellation for calls. The microphone picks up the caller's voice pretty clearly, however, it does pick up ambient sounds as well.

BATTERY LIFE

The Oppo Enco Air2 don't particularly impress when it comes to battery life. While it provides a day's worth of battery life with the earbuds and charging case combined, the earbuds alone only provide 4 hours of continuous wireless playback. This is on the lower side when it comes to competition. The Enco Air2 also doesn't support fast charging, which is

supported on both the Realme Buds Q2 and the DIZO Buds Z Pro. Charging the earbuds up to full from empty takes approximately 1.5 hours.

VERDICT

The Oppo Enco Air2 looks like a pretty sweet deal on paper with 13.4mm drivers, HeyMelody app support, and IPX4 rating. However, when faced with competing products such as the Realme Buds Q2 and the DIZO Buds Z Pro, the earbuds do fall behind in terms of features and battery life. Active Noise Cancellation and Transparency Mode being absent may not seem like a big deal at this price point, but when competing products offer these features and better battery life, it becomes hard to recommend this product.
