to consider. The most important is that the OLED Ex panels have an additional heat dissipation layer that enables them to go much brighter. This also further reduces the risk of burn-in and reduces image retention on OLED Ex panels. LG has also managed to increase the pixel aperture ratio on the new OLED Ex panels using machine learning algorithms. The Pixel aperture ratio determines how much light a section of the display can emit and a higher pixel aperture ratio implies that pixels can get brighter. LG claims that the OLED Ex panel can get 30 per cent brighter as compared to older WBC panels (not WBE panels). LG's new LG G2 which was introduced at CES 2022 is one of the first TVs to debut with the OLED Ex panel.

OLED Ex panels reduce the spacing between sub-pixels (larger aperture ratio) and have a slightly different green sub-pixel structure.

QD-OLED VS OLED EX: WHAT'S THE DIFFERENCE?

QD-OLED displays are currently being manufactured by Samsung Displays. Unlike White OLEDs that you'd get on all other OLED TVs, these panels don't have a white sub-pixel and use quantum dot colour converters instead of regular colour filters for red and green sub-pixels. This helps avoid the loss of luminance due to colour filters, enabling the panel to produce much higher brightness and support a much wider colour gamut (more than 90 per cent of BT2020) as compared to the best White OLED panels including OLED Ex.

Red and Green Quantum dots for the Red and Green sub-pixel on QD-OLED are excited using Blue light and for the Blue sub-pixel, the blue light is passed on as it is. With Quantum dots, there is no loss in energy and the complete brightness can be transmitted. This is why the QD-OLED displays essentially behave as the RGB OLED panels that you'd find on smartphones.

manifolds. The panel was first used on the LG G1 OLED TV which also won the Digit Zero1 Award for the Best 4K HDR TV in 2021.

The OLED Ex panels that were introduced in 2022 have been pitched as a rebranded OLED WBE, but there are a few other notable changes
