Only two TVs currently employ a QD-OLED panel, the Sony A95K and Samsung S95B, so it's hard to say how the overall experience will be.

Apart from TVs, Dell has launched its 34-inch Alienware QD-OLED gaming monitor that costs \$1200. As expected it supports a wider colour gamut and higher peak brightness than any other OLED monitor. On the

downside, this panel reportedly has an unconventional sub-pixel arrangement that can lead to fringing for text edges and lacks a polarizer layer on top, which makes the blacks appear grey when viewed in a well-lit room.

HOW TO TELL IF YOUR TV HAS OLED EX, WBE OR WBC PANEL?

One way to tell the difference between

WBC and WBE panels is by measuring their spectral density using a spectroradiometer. The WBE panels are characterised by a narrower blue half-width and clearer separation between the Red and Green spectrum.

Understandably, consumers don't have a spectroradiometer handy. So, the next easy way to check is to put a completely white image on your TV. Now, if you see a pink tint off-axis, you most probably have a WBE panel or OLED Ex. WBC panels show a slight cyan tint. If you have an OLED TV from LG, you can also check for WBC or WBE panel in the service menu.

The OLED Ex panel has the same spectral density and the same characteristic pink tint off-centre as the WBE panel, so you will have to check for reviews and manufacturer claims to be sure.

CAN NORMAL CONSUMERS TELL THE DIFFERENCE IN QUALITY BETWEEN OLED EX, WBE, AND WBC PANELS?

Peak brightness has been a notable shortcoming of OLED displays, and that's what LG Displays has been trying to fix with each upgrade. The Ex panel is significantly brighter as compared to the WBE or WBC and that will make a significant difference when you are watching HDR content. At the same time, OLED Ex panels used on mid-range and affordable OLED TVs might not see the brightness gain as manufacturers might choose to instead side with a longer life span of OLED material.

LG Displays will gradually phase out all other OLED panels except WBE, which is to say that consumers might not have to worry much about what panel they are getting sometime later. OLED Ex panels are currently being manufactured at the Guangzhou fab (GZ) and the older WBC panels are being manufactured at the Paju fab in China. There is no clear timeline for when the Paju fab upgrades to manufacturing WBE panels. **d**
