stages of development will not be so easy to identify.

The easy way to deal with this problem is to simply give the cooler for RMA provided it's within the warranty period. If not, it's best to replace the unit altogether. A new cooler doesn't cost that much and it's definitely the better option than replacing your entire PC should a cooler repair fail and water spill all over your components. Water damage is rarely covered under warranty terms so it's best not to risk your entire PC for just ₹10-15K.

So what should you look for when buying a new AIO CPU Cooler? The first question you should ask yourself is whether you want an AIO or will an air cooler do? Air coolers such as the DeepCool Aassassin III and the Noctua NH-D15 outperform a huge chunk of the AIOs out there and they cost around ₹9K so it's not as if air coolers aren't up for the job. If you're really set on getting an AIO CPU cooler then opt for the latest gen coolers. By that we mean getting an ASETTEK Gen 7 based cooler or even one of the new CoolIT designs. You

should ideally look for a cooler that fits your chassis. 240 mm and 280 mm coolers are at the sweet spot and also fit in most chassis available in the market. Try to look for a pump block that isn't massive and has a mounting mechanism that's easy to install and provides even pressure on the CPU heat sink. Coolers such as the Arctic Liquid Freezer II, Lian-Li Galahad and NZXT Kraken X72 are all great 360 mm coolers and their 280 mm counter parts are equally great performers that you can rely on. **[d]**

BUYING ADVICE

LAPTOPS AND GOLD

Q Hello Agent001! My folks are giving me a budget of 2 lakhs for a gift that I can get myself since I've started my new job. I don't want to spend it all on things that will depreciate in value so I'm stuck between spending all my money on a really good laptop or getting a decent laptop and using the left over money to invest in stocks or gold.

I really like playing video games, especially Minecraft and the laptop is primarily for gaming on Minecraft. Occasionally, I might download some other game and try it out but considering the last couple of years, I've barely played anything other than Minecraft. So what do you suggest that I do?

—DD

A Hey DD, Since you've mentioned that you mostly play Minecraft, I really don't see the point in spending a lot of money getting a beefy gaming laptop. The integrated graphics present on most notebooks around the 50-60K

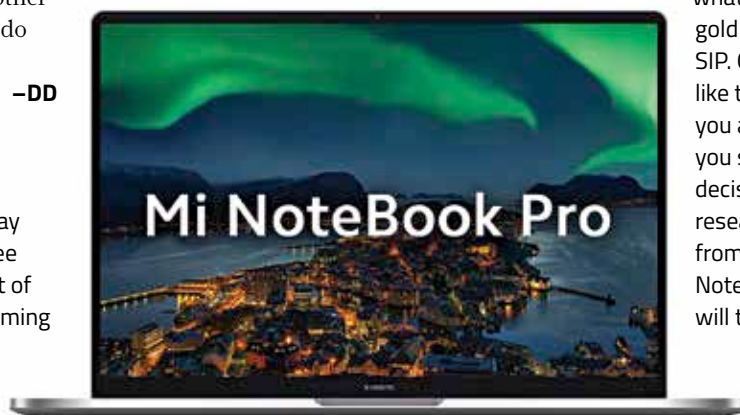

price point is more than sufficient to play Minecraft in all its glory. You can even add additional mods and improve your experience in the game and you'll still not need to switch to a better performing laptop. Unless you plan on completely stressing your laptop by installing a graphically intensive mod such as the Minecraft ray tracing mod, then you're set on any of the decent laptops within 50-60K.

The Mi Notebook Pro is a great laptop in this regard. It's sleek, has a full metal chassis and sports an 11th Gen Intel Core processor. You can get the Core i5 variant or the Core i7 variant, either one should make mincemeat of Minecraft. Of course, the Core i7 variant will be a tad better. This would cost you about ₹58K.

Now since you mentioned that you do occasionally pick up a AAA video

game, then I'd advise you to check out a gaming console. Putting aside all my reservations about console gamers, the reason I'm recommending a gaming console is because these things have a life of around 5-6 years easily and game developers are forced to optimise video games for them. So you're always going to get a good experience as long as you avoid getting games on Day-1. The Xbox Series X and PlayStation 5 are great consoles and the subscription passes available for both consoles really makes them a lot more lucrative buy than their predecessors. You could even get the Sony PS5 Digital Edition for ₹40K and get the exact same performance as the normal variant.

With the Mi Notebook Pro and console put together, you'll have spent ₹1L. Invest the remaining ₹1L in whatever way you see fit. Buy gold or stocks or invest in an SIP. Of course, at this point I'd like to say that I'm not giving you any investment advice and you should arrive at your own decision on the basis of proper research. But the takeaway from my advice is that the Mi Notebook Pro and the console will take care of all your gaming needs leaving you to invest the remaining money as per your convenience. **[d]**
