HOW SMARTPHONES ARE TESTED IN A FACTORY

Six Quality Checks Oppo Phones Go Through

Siddarth Chauhan |
feedback@digit.in

India is home to over 750 million smartphone users and it won't be an understatement to say that it will soon become one of the largest manufacturing hubs considering the hearty US\$10 billion incentive package by the Indian government to boost semiconductor manufacturing. In a country as diverse as ours where no two people have the same usage habits let alone the same climate conditions, it becomes increasingly

important for a smartphone to be tested to ensure it works as well in the heat of New Delhi as in the snow-capped regions of Ladakh, or a humid city like Mumbai.

Oppo, one of the top five smartphone brands in India invited us for a tour through their quality control lab inside their Greater Noida factory which churns out 6 million phones every month or 1 phone every 3 seconds. We saw how Oppo tests their smartphones, specifi-

cally the newly launched F21 series, ensuring high-quality standards are maintained before they go into the hands of the users.

Oppo's quality control lab takes smartphones through 320 experimental tests along with 6 major tests and only after a phone passes all these is it deemed fit for the users. Having seen these huge machines up close, I can tell you that Oppo isn't bluffing when it comes to their quality control measures as the tests being done on phones try to simulate daily use, meaning that they try and replicate real-world scenarios that a particular phone may face.

TESTED FOR ACCIDENTAL DROPS

Oppo's QE Reliability Lab performs multiple drop tests on a phone since dropping your phone accidentally is pretty common in day to day use. The idea here is that a phone must survive the fall without any cracks and functional failures for it to be able to move to the next stage.

Smartphone drop test

Now, typically the industry standard for a drop test is 0.8 meters but Oppo sets the F21 phones at a height of 1 metre for a free-fall on all sides including 6 surfaces, 8 corners and 12 edges. They took it up a notch and dropped the phone from a height of 1.5 metres for an extreme drop test.

Mimicking another daily wear and tear scenario is when we casually throw our phones on a bed or keep it on a table where the fall distance is small. The F21 series was dropped 28,000 times from a height of 10 cm which is more than the industry standard.
