

WhatsApp multi-device chatting

WhatsApp found to be testing multi-phone and tablet chatting feature as seen in recent beta version of the app. <https://digit.in/may22-41>

2 hour trials for PlayStation Plus

Sony announce free trials for any game amid rising concerns regarding sale. <https://digit.in/may22-41>

A micro drop test we saw includes dropping the F21 Pro onto sand-paper and in case you're wondering, it is not protected by a case or a screen protector.

Then comes the Tumble Test which simulates a phone slipping and colliding with a surface. The phone is placed inside a 1-meter long case which rotates at a speed of 3.5 revolutions/minute for 15 revolutions and simulates the phone being dropped 150 times from that height, ensuring that it is fit to survive everyday drops.

IPX4 WATERPROOF AND RAINPROOF TESTING

Dropping your phone on a surface is a different thing than say water, which brings a new set of problems with it. Oppo has tested the F21 series against water in the Rain Test Chamber which is in line with the IPX4 rating

IP rating testing

standard. Here, the machine simulates heavy rainfall (~10 litres/minute) on four surfaces while playing a video or on a voice call.

Only when an F21 series phone passes this test, it's further tested underwater at 20 cms for 30 seconds after which it is disassembled to check for internal water damage and signs of corrosion.

TESTED FOR EVERY INDIAN CLIMATE

Oppo then showed us how they test a phone in different temperatures and environmental conditions to ensure that it works well regardless of the climate across India. The phone is stored in chambers that have a certain preset

temperature and humidity conditions for some days and afterwards, it must function ideally to pass the test.

The F21 Pro and F21 Pro 5G have also been tested in different temperatures and environmental conditions to ensure that it works well regardless of the climate across India. The phones are stored in chambers that have preset temperatures and humidity conditions for some days after which they must function ideally to pass the test.

The environment tests include a temperature shock test where the F21 series must survive temperatures as low as -40°C and upto 75°C for 14 days. The temperatures change every other hour, giving the phone a kind of shock. The phones are also tested at -50°C to ensure its survival in a snowy region.

Next, the phone is tested in a humid environment at 95% humidity at 65°C for 14 days in both off and on modes which is double the industry standards.

The next test is critical to those living in a coastal area where the air contains high humidity and salinity. The F21 series is sprayed with a 5% salt solution for 2 hours and is stored in a chamber with 95% humidity at 50°C. The phone must survive this condition without any surface-level damage and should work normally for it to be deemed a successful test.

Oppo also conducts a sweat test where the F21 Pro is wrapped in a cloth soaked in artificial sweat and is placed inside a high temperature, humid environment for 48 hours after which it is kept aside for a day before being examined for any signs

Phones being tested in extreme temperatures

of damage and corrosion. Sometimes, smartphone components can easily get damaged in areas with little to no rainfall and humidity as static electricity builds up through friction. Oppo tests the F21 series for electrostatic contact and air discharge after which it should function normally to move to the next test.

The F21 series is also kept for 8 hours in a dust chamber with particles size of less than 75 micrometres and is disassembled afterwards to check for dust ingress.

Some of the tests specifically performed on the F21 series include testing the fibreglass leather back panel of the Sunset Orange variant. Here, the phone's back panel is rubbed with an alcohol-soaked pad, a rubber eraser and a denim patch thousands of times to simulate daily wear and tear.

Similarly, the Orbit Light on the camera module is also tested in high temperatures and humidity reaching a lifespan of over 50,000 hours,

Oppo phones undergoing camera tests

as per Oppo. Some of the camera tests that many Oppo smartphones undergo includes a focusing test, resolution test and video colour checker analysis.

Oppo runs their smartphones through a comprehensive testing process to ensure that you're getting a finished product that meets their high standards and can survive the harshest of environments. And while some of these tests are performed on every single phone, others are performed in batches to root out manufacturing defects before they hit the shelves. **d**
