ASUS Marshmallow Mouse MD100

The first thing you'll notice about the ASUS Marshmallow MD100 is its super low-profile. By low profile, we mean really low, at under 3 cm. Still, it's not as flat as Apple's Magic Mouse. However, this flat shape is something that not everyone might prefer, so keep that in mind. That being said, let's get into the specs.

The MD100 is a wireless mouse, with support for 2.4Ghz RF dongle connections and Bluetooth 5.0. You've got a toggle under the mouse, allowing you to switch between Bluetooth

connections, 2.4Ghz and turning the mouse off. The mouse is also extremely lightweight at just 56 g, and comes with a single AA battery with a battery life of 12 months. Under the mouse, you've got two DPI switches as well, allowing you to cycle between three preset DPI settings: 800, 1000, and 1600.

The switches on the MD100 are very silent, as low as 20db, Plus, they've got a listed lifespan of 10 million clicks. Certainly a mouse to consider if you want to keep the sound to a minimum.

The feature that makes the MD100 stand out however, is its antibacterial cover shells. The shells on the MD100 come with an antibacterial guard coating. While we have no way of actually testing their efficiency, it's certainly a handy feature to have, especially if your mouse tends to switch hands a lot in your work environment. The cover shell is easy to pop off, and reveals the insides of the mouse. Here you'll find the battery, and you'll find the 2.4 Ghz dongle slotted in here as well. Additionally, the strap is neatly tucked into the mouse, allowing you to pull it out whenever you might need to.

The shells also allow for a degree of customisation. They come in a few minimalist and pastel colour options (two with each box), including Quiet Blue, Solar Blue, Lilac Mist Purple and Brace Green.

Overall, the MD100 is a great office mouse for someone who's constantly on the go; it's super portable without a doubt. If you don't mind the flat profile, it's functional, aesthetic, and gets the job done.

Logitech Signature M650

We know, we've got two mice this time around. They're both pretty good portable work mice, hence, they're both here. Let's start with the first impressions. Out of the box, the Logitech M650 looks a little more stylish than your average work mouse. Not enough to draw too much attention, which is a good thing for a work mouse in our opinion. Next, coming to the build, this is a pretty well-built mouse, with a mix of matte plastic, glossy plastic, and textured rubber for the sides. On the left side of the mouse, you've got two side buttons. These side buttons unfortunately have limited customisation; they can only be reprogrammed to a select few actions, like copy and pasting. By default they function as a back and forward button, like most side buttons on mice. Other than that, the side buttons can also be held down to toggle the scroll wheel between horizontal and vertical scrolling. Under the mouse you've got the pairing button, which also acts as a

quick switch between the Bluetooth connection and the 2.4Ghz dongle connection.

Coming to connectivity, you've got a Bluetooth 5.0 connection and 2.4Ghz via a USB dongle. However, you can't have two active connections at the same time. The DPI is adjustable on PC, however it is a percentage based adjustment and not too accurate. The mouse has a pretty high click latency so it's not good for high-paced activities (read: gaming). Additionally, it's got a polling rate of 125Hz, so again, it's not very accurate for activities that require too much precision or accuracy (again read: gaming). However, for general use and office, this should more than suffice.

Like the MD100 mentioned above, the USB receiver for the Logitech M650 is also stored inside the mouse, making it very convenient for when you need to travel. Overall, the Logitech Signature M650 is a great portable work mouse, which is well-built and comfortable over long hours of use.
