

SOLAR POWERED GADGETS: THE FUTURE!

The Sun - A magnificent source of energy. So why not use it for generating electricity and saving the environment?

Navya Sharma | feedback@digit.in

The inevitable use of technology has led us to greater consumption of energy resources. And what's worse is that our non-renewable resources are slowly depleting. In order to sustain ourselves and our future generations, along with the technology we have come up with so far, it has become imperative to adopt renewable energy, and work towards making it our primary source of energy. One such energy source is Solar Energy.

We are still underutilizing the power of the Sun. It is one of the most environmentally-friendly resource and solar energy harvesting has come a long way in the past

decade. The use of solar energy has increased and with the way things are progressing solar energy use may soon beat fossil fuels. Or at least we can hope.

Solar energy is mainly powered by two technologies when it comes to converting the energy into electricity. These are Photovoltaic (PV) and Concentrated Solar Power (CSV). Apart from this the solar industry has started to expand from a small scale industry to a giant sector of the energy market.

There have been some innovative inventions which work with Solar power! Yes! How cool is that!

Mentioned below are some of the fascinating gadgets which work through solar power:

1. SOLAR POWERED CHARGER: (QiSa Solar Charger)

For someone who is always on the go, keeping your phone fully charged is a must. This solar powered charger is one nifty little gadget. It is one of the great innovations in mobile charging and other similar applications. By carrying the solar charger, you can easily charge your phone or tablet on the go. Like normal chargers it won't require electricity
