2. SOLAR POWERED BLUETOOTH SPEAKER:

(Zoook Solarmuse)

Grooving to music on hikes or while camping has never been easier with the use of a solar powered Bluetooth speaker. Their working mechanism is pretty simple.

The surface of the speaker has solar cells which collect sunlight or sometimes even man-made light, and converts the solar energy into electricity. Basically it uses the energy of the

Sun, which is a renewable resource. They are very portable and of course super easy to charge, which makes them even more versatile.

3. SOLAR POWERED HEADPHONES:

(Urbanista Los Angeles)

These are the world's first self-charging solar headphones. The wireless headphones are powered by Powerfoyle solar cell material. These headphones use green technology and convert the direct or indirect light into electricity that can then be used to charge itself. When exposed

in the sun, these headphones never stop charging and at the same time provide the user with some good tunes on the go. These headphones also have ANC or Active

Noise Cancellation and an ambient sound mode, so that the user stays aware of important sounds around them. These are available for purchase on the e-commerce site Amazon India, at ₹24,999/-.

4. WIRELESS SOLAR POWERED KEYBOARD:

(Logitech MK750)

The wireless solar powered keyboard by Logitech, is powered by light. This is a one of a kind keyboard which isn't connected by wires or cables and can be charged in the Sun. With no batteries to replace, one charge can stay up to 3 months. It is much more energy efficient, and you don't need to change batteries making it a good solar powered gadget. The keyboard uses a USB receiver, and it is travel friendly as well. It comes with a mouse, which does require batteries.

Solar powered devices are exceptional tools that help create a future which merges technological progress and sustainability. In more ways than one, these gadgets and more inventions like these will help bring back the environmental balance. In most of the developing countries as well, the use of solar power can help reduce the high rates of electricity and its consumption.

As technology advances, solar energy will get cheaper, making it more cost efficient than using fossil fuels. It is estimated that by 2030, solar energy will become an important source of electricity. This in turn, will result in having a great impact on the environment and will help prevent climate change as well.

Given the easy availability of solar power, and flexible installations, solar energy can be used to charge a small device and in future generate the electricity of a whole city as well. Solar installations will continue to grow in the coming decades.

Solar energy has given us a ray of hope. A hope that we can be greener- in small ways. At this point it has become imperative that we embrace the use

of products like this in order to reduce our dependence on non-renewable resources. With further developments, in future solar projects it won't be long before you see the majority of devices working with solar power.
