

GREEN ENERGY START-UPS

Countries are setting targets to cut down on emissions by changing the energy consumption model. As we move towards renewable energy sources, who are our allies in this long battle?

Pritam Biswas | feedback@digit.in

Climate change is upon us, and as countries strive for further development there could be more unprecedented damage handed out to the planet. The more we exhaust our natural resources, the more at risk we push our future generations. The need to protect the environment, heal the damaged ecosystems, and be able to develop has coined the term sustainable growth. The problem lies in incorporating the same into our lives. Human beings have thus turned towards renewable energy. The inexhaustible wind, solar or hydro energy might hold the key for generations to come.

Several start-ups have popped up all over the globe that direct the daily energy consumption toward a cleaner and greener source. India has set a target of elevating renewable energy capacity to 500 GW from its present 100+ GW. According to several sources, India is well on its course to meeting the set target. Meeting the

target will further need help from innovations and ideas that help in replacing fossil fuels as the primary source of energy.

Here is looking at some start-ups that are catering to the green energy revolution and strong arming the country for future generations.

RENEW POWER

ReNew Power was formed in 2011 by Sushant Sinha and today, is one the most successful independent power producer (IPP) in the country. The organisation develops clean energy through its solar, wind and hydro projects. The start-up can generate 12 GW of power assets, including commissioned and committed capacity, spread across 16 states in the country.

ReNew Power became the first renewable energy company in India to have more than 5 GW in installed capacity. The start-up which started its operations in Gujarat with a 25.2 MW capacity wind project, contributed 1 percent to India's total electricity generation in 2019-20. 2017 saw the

start-up become a unicorn. The start-up has investments from companies like Goldman Sachs and is in a partnership with Larsen & Toubro (L&T) to further the field of green hydrogen projects in the country.

ReNew Power, L&T, and IndianOil Corporation have signed a Joint Venture operation in April 2022 to research and develop green hydrogen sectors in the country in an effort to give the country a head start in the decarbonisation push.

BOUNCE

Bounce is a Bengaluru-based start-
