

up that deals in unique electric scooters. The company calls the scooters 'Infinity' owing to their charge-less functionality. Bounce eliminates the need for charging the scooter battery with its swappable battery pack. Customers can either buy the battery while purchasing the scooter or get them on a subscription basis. The company plans to set up battery swapping stations instead of charging stations so that your scooter is powered on-the-go. The subscription/rental model of the batteries will ensure the upfront scooter price is considerably reduced, as the battery of an electric scooter hikes the price of the product.

Electric vehicles are a fantastic way to reduce vehicular emissions and replace fossil energy needs with cleaner energy sources. Bounce has a manufacturing plant in Bhiwandi, Rajasthan, and has the capacity to produce 1,80,000 scooters annually. You can pre-book the Infinity E1 now on their official website for a refundable amount of just ₹499.

AVAADA ENERGY

"Where the sun powers our lives and wind lifts our dreams", Avaada Energy. Avaada Energy's official website reads the above lines and talks about their dream of a cleaner and greener change. Avaada Energy is working up on a plan of environment-friendly power plants by setting up greener sources of energy for the same. Wind and solar energy will be Avaada's allies in achieving this vision.

Avaada Energy is currently working in ten different states across the country and was the first company to have an installed capacity of 1 GW of renewable energy. They are the largest solar producer and rank within the top three renewable energy companies in India.

SEA6 ENERGY

Sea6 energy cultivates and processes tropical seaweed. The company was founded in Chennai back in 2010 and has since developed a cultivation mechanism called SeaCom-bine. It has the prowess to work in deep ocean waters and harvest and

Oceans can power a sustainable future

replant seaweeds for a sustainable ocean future.

The start-up also focuses on the production of toxin-free and environmentally-friendly products for various industries such as bioplastics, agriculture, renewable chemicals, and food ingredients. Red seaweed has been broken down into ethanol and natural gas in the labs of Sea6 green. The biofuel company taps into the unlimited potential of the oceans in a strive towards a greener future by replacing fossil fuels with seaweed.

GPS RENEWABLES

GPS Renewables, founded in 2012, wants to mitigate climate change by substituting fossil fuel with bioenergy. They work on bio methanation technology to help solve the organic waste problem. The start-up has Bio Urja (bio waste to clean energy conversion product) installations across the country which digests bio waste and produces a clean BioCNG.

The organic waste to CNG producing machine

17 tonnes of BioCNG are produced every day by a single Bio Urja plant from approximately 550 tonnes of organic waste. GPS Renewable has set a target of powering 400 buses in Indore with the CNG produced

at their plant, which will facilitate a reduction in CO2 emissions.

GREENJOULES PVT LTD

GreenJoules, founded in 2018, uses agricultural residue and renewable waste from agro-processing industries to create high-density renewable fuel which matches the same standards as that of petroleum and diesel. This factor makes clean fuel from the start-up a direct replacement for fuels such as diesel. No hazardous wastes are created during the production of the biofuel and almost all products are consumed at various end-user applications.

The usage of the fuel as a replacement for diesel can help cut down emissions as it has a negligible

GreenJoules renewable fuel

greenhouse gas footprint. The official website promises a climate change reversal through the use of green chemistry to create something that is effectively the fuel for a sustainable future.

CLAIRCO

Clairco is an Internet of Things (IoT) startup that monitors the quality of air and purifies it. Clairco enables the filters to be attached to any air conditioning by keeping them low drag. By retrofitting the ultra low resistance purifiers (the AC air flow will not be obstructed), one will be able to rid the air of dust and other smaller particles they are breathing, in real time. Filter technology is offered up to MERV 14 filtration, which essentially means your room will be free from viruses too.

The 2018 founded company is offering its solutions to businesses of all scales and charging them a monthly subscription fee. **d**
