the legend. With each keystroke giving you clicky feedback you can easily distinguish when you have registered a keystroke.

2. **Tactile** - Tactile switches are the ones that give you a more feedback throughout the entire keystroke. You feel them going down and you feel them going up. Some people find the constant feedback annoying while others live for it.
3. **Linear** - Unlike tactile and clicky keys, linear keys have no feedback. And that's pretty much all there is to it.

ESSENTIAL COMPONENTS OF A MODERN MECHANICAL KEYBOARD

Ever since the Model M dropped, it has managed to set a standard for all the mechanical keyboards out there in terms of build quality and keys. The Model M remains to be one of the most sought after boards because of the historical value that it holds and of course, the CLICK,

Most modern keyboards, however, don't follow the same build schematic as the Model M.

1. **The Case** : We start with the outermost casing of the keyboard. These casings are either made of hard plastic, brushed aluminium, or in some cases, acrylic and even wood!

A barebones kit including the stabilisers, Case, and PCB

2. **The PCB** : The PCB is usually included with any barebones kit

that you might buy to build a keyboard. This is the part responsible for the actual functioning of the keyboard, which is, taking input and translating it for the computer to understand.

3. **The Switches** : As we've already touched on switches, here's a small basic revision - Switches are responsible for the basic feedback that you get when you press a key. They also make contact with the PCB in order to complete the circuit and generate input when pressed.
4. **The Keycaps** : Keycaps are the most customisable parts of a mechanical keyboard so you can be assured that you will get plenty of options to choose from based on your preferences

PREBUILT VS. CUSTOM, WHICH ONE TO GO FOR?

The answer, like all other answers in the world, is not a simple one. While many people simply go for a prebuilt keyboard that provides them everything that you might need from a keyboard, many others, who have dared to take the leap to custom, have never looked back.

Let's weigh the pros and cons of both of your options.

Prebuilt Keyboards

Going with the more common options of the two, let's start with prebuilt mechanical keyboards. Every major peripheral brand that you can think of right now has had a history with mechanical keyboards and even now, most of them hold them in their lineup of products specified to their gaming section.

Let's list out the pros of pre-built mechanical keyboards :

1. It's in the name - it comes pre-built no assembly required
2. They are relatively cheaper compared to custom builds with the exceptions of a few over-the-top boards like limited edition ones.
3. Easier to get customer support - If you buy a pre-built mechanical

keyboard, you are sure to get customer support or at least the promise of it if you are purchasing one from a reputed brand that does indeed offer warranties.

Now come the cons:

1. Many pre-built keyboards don't actually come well-built, often disappointing the end-user who has to deal with an essential peripheral of theirs being less than satisfactory.
2. A lot of pre-builts give you switches that should have been lubed but are not, reducing the shelf life of the product and not giving you the desired experience with the product.
3. This one is a bit specific to people who are not fans of RGB. But for them, it is difficult to find a pre-built board that comes without RGB as most of the keyboards these days are gamer-centric and RGB has become a staple for them all.

Custom Keyboards

Moving on to the custom side of keyboards. Here, you will get everything you could've ever wanted in your keyboard and more! Want your keyboard to sound a certain way? Done! Want it to have a wooden case but regular keycaps? Done! Want a certain type of switch on a few keys and a different switch for the others? You got it! Custom keyboards provide you with the freedom of getting to choose every single aspect of your peripheral that you are sure to use every single day.

So without further ado, here are the pros of getting a custom keyboard:

1. Again, as the name suggests, these boards are 100 per cent customisable. From the case to the keycaps, every single aspect of the board can be chosen by you and you get to decide what goes and what doesn't.
2. You get to make sure everything on the keyboard is to your specifications, has the perfect sound that
