Disney+ is all set to release the Live Action Remake of Pinocchio on Sept. 8, 2022. <https://digit.in/jun22-59>

you desire, and is made to your exact specifications. For example - there are tons of pre-builts that might satisfy your size factor needs, but won't be being offered with the kind of switches you want. Going for a custom keyboard at a time like that is a very viable option for someone who knows what they want.

3. It's DIY! Well, not all of them are, there do exist boutique keyboard makers who make customised keyboards to your specifications and charge you a small building fee apart from the part costs but hey, that is yet again a completely optional thing. If you want, you can simply buy the parts and make the keyboard yourself.

Now, over to the cons of getting a custom keyboard:

1. They are expensive. No, like really. If you're buying parts that are going to last long, the total amount you are going to be spending will be around Rs10-15K easily. This is, however, mostly because the parts that are being sold are of amazing quality and you can obviously still find cheaper options.
2. The margin of error is huge! If you are to build a custom keyboard yourself, and you do not have any experience whatsoever doing so, we recommend you first go through a couple of guides like this one here and conduct your own research based on your preferences.
3. The process isn't exactly beginner friendly. You need to be well versed with the technicalities of a mechanical keyboard before you actually decide on making one.

HOW DO I CHOOSE PARTS?

Choosing parts for your next custom keyboard build can be tricky, but, if you get a little bit of clarity along with a dash of research, you will get the perfect formula for the keyboard you want. This is a peripheral in

which nothing but your own preference matters and you need to make sure you don't get a bit too flown away by other people's opinions.

Case Size

The first thing you need to decide on is the case size and which one to get. There are a lot of options for each and every size factor and a simple way you can decide on your perfect size, is by asking yourself what you are going to be using the keyboard for. If it's for gaming, something like a 60 or 75 per cent should be perfect for you. It gives you all the essential keys you will need in order to play your favorite games along with providing you the very important mousepad real estate that every gamer needs. Whereas, if you are someone who works in the corporate world, and absolutely always needs the num pad, like an accountant, then the obvious choice would be to get a full-size keyboard. A few of the most well-known brands for keyboard cases are GMMK by Glorious or the KBDfans. They can be found easily on websites such as pcgamingrace.com

Switches

Moving on to the part that makes the keyboards mechanical. Switches! As said earlier, there are mainly three

The Cherry MX Blues, a staple choice for clicky keys

types of switches to choose from but don't fret! A beginner such as yourself can simply go for the basic well-known switches as we said earlier. A few of the most popular and trusted brands for switches are Cherry, Gateron, and Halo.

Stabilisers

Each big key has stabilisers, and it is important to make sure you have good ones otherwise your entire experience is going to get ruined. Although you can go for the stock stabilisers that come with your PCB, if you're buying from a reputed brand such as Glorious. We recom-

mend getting third-party stabs, if you're buying something that isn't exactly off the shelf. Recommended brands include Cherry and Costar.

Keycaps

Here comes the fun part! Getting keycaps is one of the most fun parts of them all. There are literally thousands and thousands of different keycap sets based on every single popular movie, tv series, anime, and game out there so you can definitely find something you will absolutely fall in love with. For keycaps, you can start off with websites such as Keychron, or drop.com. Also, keep in mind artisan keycaps which are basically caps that come in small sets of about 2-3 and have had a huge amount of work put into them. Though some of them might even be more expensive than entire keycap sets, they certainly do add some personality to a board.

Other materials that you'll need for assembly

1. Soldering Iron.
2. Solder (1 small spool should be enough).
3. Keyswitch opener compatible with the type of switches you bought.
4. Lube - 2 kinds, liquid and greasy, specifically made for keyboards.
