Robots for household chores

Dyson is developing robots that cater to household work and plans to build robots over five years. <https://digit.in/jun22-14>

DRONES FOR POSTAL SERVICE

Faster mail delivery and remote area access via post are a reality in some countries now owing to drones. But is it the future?

Pritam Biswas | feedback@digit.in

D

rones have left their comfort zone in fiction (where they are seen fighting aliens and rescuing puppies) and

have now become a part of our reality. Military operations, wildlife conservation planning, and photography have all found refuge and innovation in this novel flying technology. The results are well and truly outrageous in terms of increased speed and decreased cost of goods delivered. The advancement of technology might see the use of drones breaching the postal service to solve a complex problem – last mile delivery.

WHY DRONES FOR POST?

Not just the speeding up of delivery of goods, but also the reliability and convenience of postal service shall increase with the usage of drones. A drone will help cut out the price involved in land and car-based delivery in remote areas such as small islands or mountainous regions. The risk involved in treacherous weather conditions of a person delivering mail in frosty winters and hot summers shall also be bypassed

via the use of drones. These conditions often stand in the way of postal services delivering mail and goods on time. The icing on the cake is that drone delivery services will significantly reduce the carbon emissions incurred during the delivery of posts.

The pandemic resulted in successive lockdowns and made way for products to be delivered through the air. Food and medicine were ferried and so were counterfeit products in certain countries. Jeff Bezos had promised to ramp up delivery via the use of drones back in 2013. Bezos envisioned faster delivery of lightweight goods through the use of drones. Before long, videos of small personal drones delivering products to one another's doorstep became viral, at a time when governments restricted people to their homes because of the rapidly spreading virus.

Amazon's delivery drone – PrimeAir

Bezos and Amazon have not yet been able to deliver on the promise of filling the skies with delivery drones even after a successful delivery in the U.K. This was owing to several failed tests over the years, the most recent one being in Pendleton, Oregon. Owing to safety concerns the company has not yet been able to drop your order from the skies. But following up on the dream of Amazon, several other countries and services have lined up postal drones.

DRONES FOR POST – A REALITY!

United Kingdom

Royal Mail in the United Kingdom has already laid out plans for postal drone service over the next three years. The plan intends to initiate 200 drones in dedicated 50 postal drone routes. Partnership with logistics drone company, Windracers, may prove pivotal in the execution of the plan. This could lead to seamless delivery of goods and services to remote communities such as Isles of Scilly, Shetland Islands, Orkney Islands and the Hebrides. These areas are connected to the Royal Mail service through ferries, conventional aircraft carriers, and land-based delivery which are more often than not affected by bad weather. Even if the Sun is shining,
