

PCIe 5.0 SSDs – How fast?

At COMPUTEX, Apacer and ZADAK announced their consumer PCIe 5.0 SSDs. CPUs supporting this standard have been out in the market for quite some time. But there weren't any offerings in the market for the consumers to reap their CPU's capabilities. Now, there are not one but two different ones to choose from.

Apacer and ZADAK's PCIe Gen 5 SSDs can reach read and write speeds up to 13,000 MBps and 12,000 MBps,

respectively. Both the announced drives are similar in terms of their offerings. For example, both support the NVMe 2.0 standard and will have a 5-year global warranty. But there are subtle differences that might affect the buying choice of the consumers. The biggest is the cooling mechanisms that the two manufacturers have opted for. Apacer opted for an aluminium heatsink. On the other hand, ZADAK will have two different heatsinks. The first is made with ultra-thin graphene and the other with aluminium.

The already existing Intel Alder Lake CPUs and the new Ryzen 7000 series CPUs have support for this latest generation of SSDs. Fourth-generation PCIe SSDs were able to transfer data at half the speeds of what these new offerings from Apacer and Zadak are capable of. These drives will be backwards compatible with the Gen 4 standard with an obvious performance dip that would come with it.

MediaTek Wi-Fi 7 Access Points – Faster internet, without wires

Taking the lead in the race to reveal Wi-Fi 7 hardware, MediaTek shed some light on its Filogic 880 platform. Having announced the platform back in January itself, the company shared technical details of the platform during COMPUTEX 2022.

During the announcements,

The platform's WiSoC, fabricated on a 6 nm process, was touted by the company to have higher energy efficiency than other companies.

NZXT H7 – A case for everyone

The popular case manufacturer NZXT's three new offerings broke the surface during the event. Named the H7 series, they come as a replacement for the H710 cases. Each of the cases should have more space and cooling along with other "streamlined building features". To add to it, NZXT also announced the launch of accessories that would make H7 builds look and work better.

NVIDIA Grace Systems – Now adopted by all

Another major announcement from the NVIDIA camp was that the biggest Taiwanese computer makers would soon be releasing new NVIDIA Grace powered systems. These makers include ASUS, Foxconn Industrial Internet, GIGABYTE, QCT, Supermicro and Wiwynn. They are expected to deliver these systems by the first half of 2023.
