AM5 Motherboards – One by everyone

For the newly launched CPUs from AMD, a line of new AM5 motherboards was launched during COMPUTEX. Three chipsets were put out – the X670E, which has “extreme overclocking capabilities”, the X670, the tamer cousin of the X670E, and the B650 that will be focused on a much more toned-down use of the new Ryzen CPUs. While choosing the chipsets, it is crucial to know exactly what one would be doing with their PC when they build it. This is because each one would have its limitations and capabilities.

The AM5 motherboards come with as many as 24x PCIe 5.0 lanes, support for Wi-Fi 6E, and up to 4x display outputs, including HDMI 2.1 and DisplayPort 2.0 ports. Offerings from different featured brands include the ASRock X670E Taichi, GIGABYTE X670E AORUS Extreme, and the MSI X670E Ace.

COMPUTEX NFTs – It’s like a reward

Rounding up the event in the trendiest way possible, COMPUTEX announced an NFT, substituting the traditional souvenir tokens. There were six different NFTs dropped, with each one covering the six different themes of the exhibition areas. The NFT was issued on the Tezos blockchain. They were given out to individuals completing different tasks. One of them was to click six themed photos from the exhibition floor and upload them onto a webpage.

The only prerequisite was that everyone wanting to get their hands on the NFT would be required to register with an exclusive wallet. After all of the prerequisites were fulfilled by individuals, a random NFT would be dropped into their wallet during the event. The recommended wallets for this were Kukai and Temple, with Kukai being the preferred one to be used by newcomers.

NVIDIA Liquid Cooled GPUs – Saving the environment!

The Big Green, NVIDIA, introduced its liquid-cooled GPUs for server and data centre applications at COMPUTEX. This was done keeping in mind

their consumer base’s demand for high-performance and green data centres. As per NVIDIA, if data centres shift to liquid-cooled GPUs, it would help in eliminating chillers which use water to cool the air inside the data centres.

MSI – They have whatever you need

MSI was another brand that made a lot of announcements. The announcements ranged from AIoT solutions and PC components all the way to a new branding for its products.

Starting with computer components, along with the motherboards for AMD’s 7000 series,

there was a new power supply announced. It was the new MEG Ai1300P/Ai1000P PCIe 5.0, ATX 3.0 ready PSU, with an 80Plus Platinum rating. The brand also announced that their existing line of liquid coolers would be compatible with the new Socket AM5. For AIoT solutions, MSI announced customised servers, industrial computers, robots, and automotive electronic products.
