Analogue Pocket to get Beta update

Analogue Pocket will get new features like developer tools and a massive handheld games wiki. <https://digit.in/jun22-73>

ephoto lens with 3x optical zoom and a 20-megapixel monochrome sensor.

By the end of 2018, Samsung introduced the Galaxy A9. It was the world's first phone to have quad cameras featuring a 24-megapixel main camera, an 8-megapixel ultra-wide camera, a

Apple iPhone 7 Plus with dual cameras

10-megapixel telephoto camera with 2x optical zoom, and a 5-megapixel depth sensor. This was, without a doubt, a capable and versatile camera setup that allowed users to switch between different focal lengths with just a press of a button.

This didn't stop here. Nokia, backed by HMD Global once again tried to push its luck with its flagship phone. The Nokia 9 PureView debuted in 2019 and featured five cameras on the back.

Samsung Galaxy Note 8

Still, two or more cameras were seen as sort of a flagship feature, unlike today where you can easily get multiple cameras in phones priced around Rs 10,000. This is a result of the trickle-down effect in technology where high-end features are now found on affordable phones, as a result of fast-paced development.

Huawei P20 Pro

Brands also started to fine-tune the camera software that allowed them to offer features like the portrait mode, night mode, astrophotography mode, long exposure, filters and more.

Slowly, the development shifted from multiple cameras to higher resolution 64-megapixels and 108-megapixel sensors in smartphones. But at the same time, brands started to focus on full-sized immersive displays which meant they had to find ways to hide

the front-facing camera giving birth to concepts like pop-up camera modules and the implementation of different types of notch cutouts that are pretty common nowadays.

WHAT LIES AHEAD?

Today, it would be an understatement to say that cameras have become a very important aspect of life, which looking back no one would have been able to foresee. We have gotten to a point where most smartphones across different price ranges are capable of clicking great pictures. Also, with

the recent push in the consumption of videos, smartphone brands have re-oriented their focus on developing camera systems that can create equally great photos and videos.

Selfie cameras have gotten better at reproducing skin tones that are close to natural. But, with so many features at their disposal, they can also be used to morph facial elements to give them a

better but unnatural look. It's a choice that's part of the larger societal impact that camera-related social media filters are currently driving, allowing people to express themselves in any way they would want.

Another area where brands have made headway is in partnering with legacy camera brands to bring in a bit of nostalgia. For example, the X-Pan mode on the OnePlus 9/10 series in collaboration with Hasselblad or the Zeiss anamorphic lens effect that powers the cinematic mode in the latest Vivo X80 series.

While the modern smartphone camera isn't a DSLR replacement yet, it has closely bridged the gap between amateur photographers and professionals by providing ease of preserving stellar photographic memories from a device that fits right into your pocket.

The next big thing in smartphone cameras is the under-display cameras. They will eliminate any kind of notch or mechanical system to make the selfie camera invisible to the eye, but the camera will be able to see past the pixels on the screen!
