

Popur X5

Funding: US\$ 248,769 pledged of US\$ 10,000 goal

Link: <https://dgit.in/popurx5>

Taking care our beloved pets is an enriching experience. For the most part. The poop-scooping times, however, can be a bit of a turn off. Enter the Popur X5 – a self-cleaning litter box for cats with a unique two-box system. The unit is not just capable of cleaning litter but it also can track your pets' health, behaviour and more. Most self-cleaning litter boxes come equipped with a rotating drum and a receptacle underneath, however, they aren't the most hygienic

and seamless options. The Popur X5 attempts to solve this by eliminating a single channel for waste collection and management. This device comes with a two-box system – one box for the litter

and another one for the excrements. The device is available in two variants – the Basic one with a cardboard waste bin which needs to be manually discarded and the Pro variant with an automatic waste bin. The device's DuoTilt technology combines a two-tilt action where the initial one sifts the litter and the subsequent one dumps the waste. Such a system helps in avoiding loss of litter and keeps the box fresh and clean 24/7. The Early Bird Pledge will get you the Basic variant for \$279 while the Pro variant will set you back by \$329.

Luba

Funding: US\$ 1,811,997 pledged of US\$ 6,730 goal

Link: <https://dgit.in/luba>

Luba is a smart, wireless robot lawn mower with no requirement for inconvenient perimeter cables to keep it running. It provides a fully handsfree experience and is easy to use as well. The device features RTK (real-time kinematics) navigation and an interconnected smart system. The combination of the two allows users to program virtual zones into the app's schedule. The device can automatically map and mow lawns without the need for perimeter cables. All you need to do to set it up is, walk with Luba along the boundaries of your lawn. The AI smarts of the device will automatically program cutting zones without the hassle of digging and burying wires. RTK alongside multiple sensors ensures precise positioning of the cutting zones, making the lawn mowing process a breeze. You can also create no-go zones via the app, protecting areas where you don't want the lawnmower going. If your lawn is split up into several zones, the Luba can also be programmed to recognise multiple zones via the Multi-zone Management feature. It can automatically perform jobs in different zones and you can also add connecting paths for the lawnmower between these zones. The device can be purchased for approximately \$1,270 for a limited time period.

CoreCap

Funding: US\$ 104,109 pledged of US\$ 53,723 goal

Link: <https://dgit.in/corecap>

Bike computers can be useful but are usually pretty bulky and can hamper the aesthetics of the bike. The good folks over at Core have attempted to solve this with the CoreCap integrated bike computer. The sleek unit is fixed onto the steerer tube of the bike and it is fully customisable. The usual bulky devices on the handlebars are eliminated; giving you a minimalist look. The CoreCap also automatically turns on and starts recording every ride, without users having to push a button to do so. The small screen can be customised with up to 5 preset screens

and users can switch between these screens during rides. The bike computer also connects to the CoreCap app which allows granular control over all its fea-

tures. The manufacturers have also integrated apps such as Komoot, Strava, Google Maps and GoPro. The app saves your activities and you can also check your riding history and progress whenever you please. You also get other utilitarian features such as turn-by-turn navigation and smart notifications. The manufacturers have claimed that the device

is easy to install with no special tools or modifications required to the bike. You can pick up one for €239 for a limited period on Kickstarter.
