Google Pixel 6a

Reasons to buy it
can fit in the space
of a pixel

Boo-Man | boo@digit.in

A

h, the Pixel... I remember the early days when I was looking forward to booing the latest

from Google. Yet I couldn't do much because of how gosh darn good they were – as cameras, at least. Oh how the tables have turned though, with the launch of the Google Pixel 6a earlier this month. Having tasted blood with the flagship offering of the series, I was really looking to sink my teeth into this next offering, and Google didn't disappoint! They didn't disappoint me, that is, which means you should prepare yourself!

Let me start by addressing the biggest issue of this launch, which is the price. At its \$449 launch price, it is about the same price as its predecessor in the budget line. Normally that's a positive... a year on and no increase in price is often a win. Not the case here. There are a dozen different offerings from competing brands, which in different aspects one-up the boiling hot piece of silicon and plastic that this phone is.

In 2022, when you are shelling out the amount of money you are for this phone, as a consumer, you deserve at least a 90 Hz display, and everyone expected the manufacturers to put one in the phone, hoping that for once, the creators of the phone would do the right thing. You know what, each one of them was WRONG! Google, in all their wisdom, will be shipping the phone with a 60 Hz display. This is the moment when I

Source: Google

will be swarmed with spec sheets of the iPhone SE Gen 3, or whatever it's called. People will call me a b*tch hurt critic who shuts his eyes to the flaws of the other device. Don't waste your breath, remember who I am. I hate that phone with a passion too! No one in their right mind would ship a design so outdated that my memory doesn't even help me recall when it was launched and a screen so bad that my car's infotainment system beats it on specs. So chill!

Next up is the storage system. What is up with these tech giants locking their devices in a single configuration in key areas like storage? It's like they don't know that 128 GB is just not a lot these days. And what if I want more? What if I am a Pixel die-hard fan and want to shoot a picture every 3 seconds and post it to Instagram with #NoFilter and #ShotOn-MyPixel so that I can beg for likes and call myself an influencer? What then? I know, I have to pay Google (or some other stupid cloud storage service) for additional space, all because Google decided to follow others and screw us out of the option to have expandable

storage. Don't be Evil means don't be evil Google, not be just as evil as the next guy.

These Android brands love to mock Apple on social media, only to follow them and do exactly the same a heartbeat later, because the stock-market demands it! It's a BUDGET phone Google, stop screwing us poorer people over, and let us buy additional storage for our phones! Samsung might be just as driven as you to do well on the stock market, but they still offer an SD card slot on their competing phone, the Galaxy A53. While the Galaxy A53 is nothing to write home about as a device, it still costs the same as this Pixel 6a, has more camera hardware packed inside, and a better screen for you to admire the pictures that you click.

Before my veins explode looking at the spec sheet of different 'budget' phones, the thing that I would like to point out is the launch strategy that Google adopts when putting out devices in their 'a' lineup. Take the example of the Indian market. The last 'a' series device that the Indian markets saw was the Pixel 4a, and it did pretty well. Then they skipped a few launches citing the 60 GHz operations of their chip and some other weird excuses including chip shortages, or whatever. And honestly, that makes me feel a little neglected as an Indian. The whole world is bending over backwards to tap the Indian market and the Pixel phones are suddenly too good for India? Wonder which suit in Google took that decision, and I wonder if he still has his job...

Honestly, even Apple has its whole range available here, and they're far pricier, so what caused Google to risk being forgotten by Indian customers by jumping out of the market is a mystery! Have we forgotten about Pixels? Let's see...
