

ROADMAP TO ELECTRIC VEHICLE ADOPTION IN INDIA

We've got a lot of barriers ahead of us before we can fully begin embracing EVs

Vaidyanathan Subramaniam | feedback@digit.in

India, a nation with a thriving population of 1.3 billion and counting, imports a large chunk of its energy needs from other countries. India has been contemplating on reducing this dependence and has set ambitious goals of reducing energy intensity by 33-35% by 2030 compared to 2005 base year.

India has more than 295.8 million on the road (as of 2019) and the automotive industry contributes 7% to the country's GDP. The COVID-19 pandemic has reduced worldwide use of oil

owing to lockdowns leading to steep oil and gas prices, and the recent Russia-Ukraine conflict has only helped fuel prices soar with oil hitting US\$139 a barrel at one point.

Rising environmental concerns is another important aspect that is being pegged as a motivator for going electric. India currently has 35 of the 50 most polluted cities in the world with pollution levels that are eight to 23 times the WHO-permitted limits.

Adoption of electric vehicles (EVs) is being advocated as a panacea for

reducing India's dependence on fossil fuels and mitigating air pollution. However, the road ahead is not a smooth travel and there are several teething issues to address before our roads get fully electrified.

CURRENT STATUS OF EV ADOPTION IN INDIA

India has set a goal of achieving a significant penetration of EVs by 2030. This includes at least 30% private cars, 70% commercial vehicles, and 80% of two and three-wheelers, which will
