

Crunchyroll announce Trigun reboot

Yasuhito Nightow's Trigun to get a reboot after Sony's Crunchyroll acquires it from Toho. <https://digit.in/jul22-21>

Say hello to Floppotron 3.0

Floppotron 3.0 the PC Orchestra contains 512 floppy disk drives, 16 hard drives and four flatbed scanners. <https://digit.in/jul22-23>

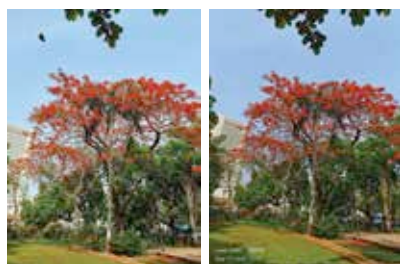

camera headlining the trio. You get a 12 MP primary lens with f/1.8 aperture and OIS support. There's an 8 MP telephoto lens with f/2.4 aperture, OIS, and 3x optical zoom. There's also a 12 MP ultrawide shooter with an f/2.2 aperture. The device's cameras also come with auto HDR.

For selfies, the phone sports a 32 MP lens. For video, the phone can shoot 4K at 30/60 fps and 1080p at 30/60 fps from the rear camera. For selfies, 4K and 1080p shooting are possible at 30/60 fps.

CAMERA COMPARISON

Primary camera

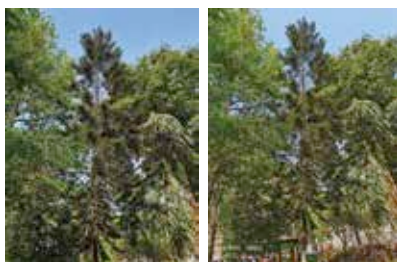

Let's get started with images taken in daylight. Vivo has a slightly wider field of view so the photos you click have a wider angle. Both phones capture social media-ready photos, however, you may feel that Vivo's photos are slightly more social media-ready. We took multiple photographs from both phones and the dynamic range was much better on Vivo with more detail captured in the shadows and highlights. But sometimes the tide turns and Samsung's camera actually produces photos with a bit more dynamic range, but that is a rarity. Vivo also has a dedicated 50 MP mode which produces more detailed photos,

Samsung Galaxy S21 FE (left) vs Vivo X80 (right)

especially if you zoom into the picture or pixel peep.

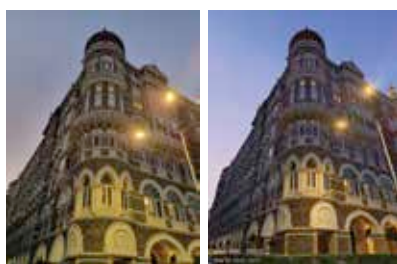

Moving on to image sharpness, generally, Vivo's images are slightly sharper, especially if you're clicking pictures of moving objects. The shots usually appear a bit blurry on the Samsung. Human subjects, however, appear more true to life on Samsung.

Samsung Galaxy S21 FE (left) vs Vivo X80 (right)

Vivo washes out the colours of human subjects. We faced some issues where pictures of human subjects clicked on the Vivo X80 appeared fairer than real life or slightly orange.

Aside from pictures of human subjects, in photos of landscapes or nature, colours appear more true to life on the Samsung. However, if you turn on Zeiss Mode on the Vivo X80, some semblance of colour accuracy appears. In fact, we were extremely impressed by how natural the colours looked with Zeiss mode turned on in

various instances and suggest that you keep this mode active at all times. Low light images on both phones are decent, but we found Vivo's nighttime photos to be more detailed; both with night mode turned on and off.

Both phones' portrait images look decent but Samsung's portrait shots look a bit too artificial at times. We could see instances of mistakes in the edge detection on both phones, especially around the face and hair. In low light, Vivo clicked more usable portrait shots but the edge detection was a bit wonky and unrefined. Using the telephoto lens, the Samsung S21 FE's portrait shots were definitely much better, especially around the face. Portrait images taken in low light from the telephoto lens are almost unusable

on both phones – Vivo struggles with edge detection again while Samsung's shots are ridiculously grainy.

Next, we move on to close-up shots. Both phones click eye-catching pictures with great natural background blur. Vivo, however, can go one step further and click macro shots as well which have quite a lot of detail and good colours.

Telephoto camera

Let's recap. Samsung's camera provides 3x optical zoom while Vivo is capable of 2x optical zoom. We already spoke about portrait photos from the telephoto lenses. In normal photos, Vivo's dynamic range on this lens is superior with better detail captured in highlights and shadows. Samsung clicks decent photos as well but its ability is masked by Vivo's
