### Hideo Kojima, 'RRR a must watch'

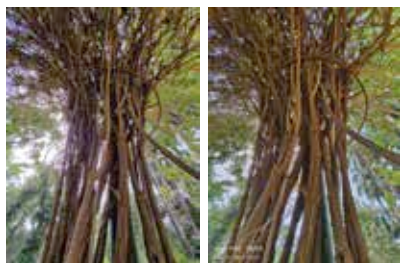

Legendary Japanese video game designer Hideo Kojima has called S. S. Rajamouli's RRR a must watch. <https://dgit.in/jul22-25>

proficiency when it comes to the telephoto lens' prowess.

One advantage Samsung has though is that it can capture subjects much further away without losing out on detail and switching to digital zoom. In low light, Vivo's telephoto lens captures more detail but Samsung's colours appear more true to life. Samsung has done really well so far at keeping the integrity of colours intact across its lenses, which is great. Vivo, however, has been more consistent with detail.

### Ultrawide camera

Now let's move on to the ultrawide camera. Ultrawide lenses usually allow you to squeeze a lot more into the frame than you would normally be

Samsung Galaxy S21 FE (left) vs Vivo X80 (right)

able to capture from primary lenses, which allows for some interesting shots. Both cameras are equally proficient at clicking photos from the ultrawide with good detail and colour. Both the Vivo X80 and the Samsung Galaxy S21 FE had minimal barrel distortion, but if we were to give the edge to one phone, it would be the Vivo X80.

In low light, Samsung's ultrawide photos have quite a lot of noise, especially in the corners. However, once again, colours continue to look more true to life on Samsung. The Vivo X80 ups the contrast and vibrancy a bit too much at times, making photos look over-processed or artificial.

### Selfie camera

Now let's talk about the selfie cameras. Samsung's selfie camera provides detailed pictures with close-to-life colours and textured skin. Vivo also

clicks excellent selfies that are quite social media-ready, however, the edge for colour accuracy once again goes to the Samsung S21 FE. Nevertheless,

Samsung Galaxy S21 FE (left) vs Vivo X80 (right)

the details in selfies are excellent on both phones, you won't really have too much to complain about, especially in photos taken in broad daylight.

However, if you speak about low light selfie image quality, Samsung takes a hit with grain and noise creeping up in the images making them look inferior compared to Vivo's low light selfie shots.

### Video performance

Finally, we move on to video. Both phones are capable of capturing great video footage, specifically during the day. We shot footage in 4K and 1080p and were quite pleased with the results on both the Vivo X80 and Samsung Galaxy S21 FE. The results were quite similar, with both phones capturing detailed videos with good colour reproduction. However, if you do pixel peep, you will definitely find Vivo's footage richer in detail. This is even more apparent in low-light videography where the Vivo X80 generally captures much more detailed videos since more light is let in through its sensor compared to Samsung's sensor.

However, video stabilisation is a race that the Vivo loses since Samsung absolutely decimates it with its Super Steady Mode turned on. Vivo also comes with a stabilisation mode, however, Samsung's camera is just more competent in this regard. Vivo does have one special stabilisation feature that is missing on the Samsung S21 FE dubbed Horizontal Line Stabilization. Using this mode, no matter how much

you move the phone, footage remains perfectly horizontal.

Both phones also come equipped with Slow Motion video support and the footage looks pretty decent on both devices. Samsung, however, is capable of Super Slow Motion mode as well which outputs footage at a crawling 960 fps at 720p. However, this is a mode you should only use in bright daylight; anything less and you will end up with pretty unusable footage filled with grain and noise. Moving on to auto-focusing, the Vivo X80 struggles considerably more than the Samsung to fix focus on subjects, especially in tricky lighting conditions.

### VERDICT

So the question remains, around the ₹50,000 price point, which phone has the better camera array? Is it the Vivo X80's 50 MP camera system or is it Samsung's 12 MP camera arrangement? The answer, unfortunately, is not too conclusive. On one hand, the Samsung Galaxy S21 FE is thoroughly defeated by the Vivo X80 in low-light photography and general videography. But, on the other hand, the Samsung Galaxy S21 FE reigns supreme in colour accuracy and portrait mode images. However, Vivo's saving grace here is Zeiss Mode which provides pretty true-to-life colours in comparison to Vivo's default colours.

However, if we were to crown one phone the winner – it would have to be the Vivo X80 just because we feel it is the more reliable point-and-shoot camera for beginners and professionals alike. You get fantastic daylight images and videos with oodles of detail and sharpness, and pretty decent low light results as well. Samsung is just way too inconsistent when it comes to low-light photography and videography which has caused the scales to tip in favour of the Vivo X80. However, you can't really go horrendously wrong with either of these cameras around the ₹50K price point. To see all the images and videos we shot on these phones, head over to this video - <https://dgit.in/camcompare1>.
