

U.S. needs a standard charger

Lawmakers have said that the United States needs a standard charger for all its devices. <https://dgit.in/jul22-28>

Gran Turismo in August 2023

Sony's upcoming Gran Turismo film will debut in August 2023 according to Deadline. <https://dgit.in/jul22-29>

It features a 64 MP primary sensor, an 8 MP ultrawide shooter, and a 2 MP macro lens. For selfies, the phone houses a 16 MP Sony IMX 471 camera. You get features such as AI Highlight Video, Portrait Flare Mode, HDR support, gyro-EIS, and Phase Detection Auto Focus. For videography, the phone supports 4K at 30 fps, and 1080p at 30/60/120 fps. Selfie videos have a maximum resolution of 1080p at 30/60 fps.

CAMERA COMPARISON

Primary lens

Images clicked in broad daylight look good out of the box on all three phones. The Samsung Galaxy M53 5G's pictures have a cooler tone than the Realme 9 Pro+ and the OnePlus Nord CE 2, but colours look pretty vibrant on all three devices. However, in close-up shots, you will find the most amount of natural depth of field on Realme's shots. While all three phones take pretty decent close-up shots, the Samsung Galaxy M53 struggles to lock focus on subjects such as flowers. There were several instances where the Realme and OnePlus managed to focus on subjects like champs but where the Galaxy M53 stumbled.

Moving on to dynamic range, while all three phones do their price justice in this regard, the OnePlus Nord CE 2 has the undisputed best dynamic range. There's oodles of details captured in the shadows and highlights alike, without blowing either out of proportion. Samsung, especially, struggles at maintaining details and often crushes shadows or overexposes highlights in tricky lighting conditions. As for sharpness, we found Realme's images to be the most crisp of the lot, followed by OnePlus and then Samsung. Samsung's

images come out looking a bit too soft for our liking, at times. Realme and OnePlus also come with 50 MP and 64 MP modes respectively that adds a bit more sharpness to the images, but sometimes at the cost of dynamic range.

Human subjects look most true to life on the OnePlus Nord CE 2, however, you may find Realme's pictures more popping and ready for social me-

ral and accurate enough representation of colours. Realme doesn't lag too far behind, but put a person in the frame instead and Realme will try to whiten and smoothen their skin aggressively.

Macro lens

The Realme 9 Pro+, One Plus Nord CE 2, and Samsung Galaxy M53, all come boasting a 2 MP macro shooter for ultra

Samsung Galaxy M53 (left), Realme 9 Pro+ (middle), OnePlus Nord CE 2 (right)

dia. In harsh backlighting situations, Realme also manages to keep the human subject properly exposed while the others struggle a bit. However, human skin tones look washed out on the Realme with a lack of detail in skin textures. Portrait images come out the most consistent on the OnePlus with the most accurate edge detection of the lot. No phone on this list is perfect when it comes to edge detection, but OnePlus makes the least mistakes here. Additionally, we found Samsung and Realme's portrait blur a bit too aggressive, but you can bring it down on the Samsung after clicking the photo, via the Gallery app.

Moving on to colours, yet again the OnePlus Nord wins the race with natu-

close-up shots. Colours appear pretty natural on all three but Samsung does overexpose the subject a bit. These macro lenses are pretty low resolution, so you aren't going to get fantastic results from any of them, but Samsung's shots look the most usable of the lot.

Realme's macro images have a ton of noise in them, more so than the other two phones. Overall, Samsung takes the win here, OnePlus is the runner-up and Realme comes in last, which is surprising since the 9 Pro+ comes with OIS support. Realme may need to work on tuning their macro lens more to output better images.

Ultrawide lens

Moving on to the ultrawide lens, the Samsung, Realme, and OnePlus sport an 8 MP lens. Photos from the ultrawide lens of all three phones are quite pleasing to the eye with decent colour reproduction. However, the OnePlus, yet again, bests the other two when it comes to dynamic range. There's also quite a good balance of
