colours between the primary and ultrawide lens on the OnePlus, making photos from both lenses look alike.

In terms of detail retention though, Realme takes the cake with crisper shots. While OnePlus' shots are also pretty crisp, they look slightly artificially sharpened which makes them look unnatural. Samsung again struggles with the details in shadows. However, it has the widest ultrawide FOV (field of view), which allows you to capture more in the frame. Barrel distortion is minimal on all three phones, but the Realme shows a bit more corner distortion than the other two.

Selfie lens

Now, let's talk about selfies. Samsung's selfie images look the most natural with true to life skin tones followed by the OnePlus, which clicks pretty decent selfies too. Realme's selfie images, on the other hand, look artificial even with beauty mode turned off. In portrait selfies, we found that the Samsung has the best edge detection as well, making selfie shots look fantastic in most lighting conditions, except... low light.

Low light photography

Let's start with low light selfies. Samsung's selfie images are downright unusable with excessive noise and grain. Realme takes decent selfie pictures in low light, especially with night mode turned on. However, you may see a bit of lens flare in low light images from

the Realme. OnePlus' low light selfies, while not perfect, come out looking the most detailed and sharp.

For low light pictures taken from the rear camera, Realme's Pro Light Imaging technology proves to be very useful. Low light images from the Realme 9 Pro+ have a lot of detail and character. OnePlus leverages its Nightscape technology to take pretty impressive low light images as well, however, they're not as impressive as Realme's night-time shots. Unfortunately, Samsung's low light images are very inconsistent with it looking decent in some shots but poor in others, with lots of loss of detail

Samsung Galaxy M53 (left), Realme 9 Pro+ (middle), OnePlus Nord CE 2 (right)

in the corners. Realme also has some extra night time modes such as light paintings, light trails and more that you can play around with.

Videography

In daylight, videos come out looking good on all three phones but Realme's footage is a tad too saturated for our taste. AI makes the footage too colourful and unnatural, so we suggest turning it off on the Realme 9 Pro+ at all times. All three

phones can shoot slow motion videos but Realme takes it one step further with Super Slow Motion videos at 960 fps but the resolution is capped at 720p, so it won't be the most detailed footage. Stabilisation is pretty wonky on all three phones, however, Realme managed to stay the most stable when we ran with the phones in hand due to OIS support. In low light, videos come out looking noisy on all three phones, but Samsung's footage showed the most noise.

VERDICT: WHICH PHONE WINS?

So the question we set out to answer at the beginning of this article was which of these three phones has the most consistent and versatile camera setup under ₹30,000? Is it the Samsung Galaxy M53's 108 MP camera system or is it the Realme 9 Pro+'s feature-laden camera setup? The answer is neither of them. If you are looking for the most consistent

camera experience in a smartphone under ₹30K, the OnePlus Nord CE 2 is the one for you. You get pictures with fantastic dynamic range, sharpness and colour accuracy in daylight and you also get the most consistent portrait photos out of the three phones. Low light photography is also pretty decent with OnePlus' Nightscape mode. However, where the Samsung beats the OnePlus is macro and selfie images while the Realme beats the OnePlus at low light and ultrawide images. However, for the primary lens, the OnePlus Nord CE 2 has the most impressive overall camera performance under ₹30,000. To see all the images and videos we shot on these three phones, head over to this video - <https://dgit.in/camcompare2>.
