Corsair HS65 Surround

Comfort and quality on a budget

The Corsair HS65 Surround is a new mid-range gaming headset offering that is a direct improvement over its predecessor, the Corsair HS60 Pro Surround. Let's see how it performs.

BUILD AND DESIGN

The HS65 Surround has great build quality. It uses solid aluminium for the headband and ear cup mounts. The headset features matte white plastic ear cups, with a metal grille design in the middle. Overall, the design looks pretty premium and classy.

We've got comfortable memory foam earcups on the Corsair HS65 Surround, with cloth on the surface of the earcups, i.e., the parts that touch your head and ears, and protein leather on the edges of the earcups. The same thick memory foam is also present under the headband, on the part which rests on your head. Overall, we have no complaints in the comfort department.

The headphones sit pretty snugly on your head thanks to the powerful clamping force on the aluminium headband. For on-ear controls, you have a single volume dial. They've done away with the mute button entirely in favour of a flip-to-mute microphone. Excellent.

The device comes with a USB-A dongle, which you'll need in order to use Dolby Surround Sound. However, there's no surround sound toggle on the earcups, the only way to do so is via the iCUE software or through Windows Sonic or DTS.

PERFORMANCE

By default, the Corsair HS65 Surround supports stereo audio. When used with the provided USB Dongle, you also have access to Dolby Surround sound. Additionally, via iCUE you have customisable EQ which is always a plus. Keep in mind that all these features are only available to you if you use the USB dongle. However, the fact that it can be

used via the 3.5mm plug opens up many options; you can use these with your smartphones and other consoles as well, effectively making these a pair of cross-platform gaming headphones.

Coming to the audio performance, we found it to be pretty good overall, especially at this budget. The EQ defaults to Pure Direct by default; the audio is more flat in this preset. However, tweaking the EQ can make a world of a difference. The HS65 is powered by 50mm neodymium drivers, which do a great job with the lows without losing out on the details of the mids and highs. While gaming, you'll be able to enjoy the explosive carnage without needing to sacrifice on the more minute details such as voices and more importantly, footsteps.

Speaking of footsteps, with 7.1 surround sound enabled, we found that we were able to get good positional awareness while in game.

The Discord certified omni-directional microphone on the Corsair HS65 is also excellent. It has great clarity, voice is clear and there's no distortion. The hum of the AC, sounds of traffic, construction etc, nothing gets through. However, it picks up voices really well. A bit too well in fact. If there are any other people speaking

in the same room as you, the microphone will pick up their voices as well. So this can get a bit annoying.

FEATURES

The Corsair HS65 Surround can be used out of the box as a simple plug and play device. However, like you mentioned you will need the Corsair iCUE software in order to use Surround sound, create custom SoundID profiles, and adjust the EQ. You can take this a step further with the new feature – SoundID technology. This has been designed to let you tweak audio to your personal preference. The final result is subjective, but we found it to be fairly effective. As an experiment, we attempted to create a sound profile that brought out the highs and mids, and subdued the lows. The resulting SoundID actually managed to pull this off.

BOTTOMLINE

The Corsair HS65 Surround features great build quality, comfort, an attractive and minimalistic design, and most importantly also delivers when it comes to audio performance. The 7.1 surround sound performs admirably, and it has a good overall sound profile with decent bass that doesn't drown out the mids and highs. While the headphone is not yet out in India, assuming it'll cost around the same or slightly more (around ₹7,000 - ₹7,500) than the Corsair HS60. What we've got here is a solid budget mid-range gaming headset with premium performance and features.
