Sony X75K

A pricey affair

Sony has been one of the biggest names in the television business for years now. While many factors have contributed to this, the primary is the company's ability to deliver solid performing televisions year after year. Sony X75K is the company's entry-level premium segment TV for the year. But is it the TV for you? Let's find out.

BUILD, DESIGN AND AUDIO

The build of the X75K is very similar to what we have seen on previous generation premium segment TVs from Sony. The placement of the ports is on the right side of the TV facing outwards. We have two USB ports, optical audio out, 3 HDMI ports, and an ethernet port. There is also a 2 speaker set-up at the base which is tucked nicely within the body of the device. This is a 20W (10W+10W) Open Baffle Speaker set-up, which does offer good sound. While not the clearest, the loudest, or the most bass-heavy, the speakers on the TV do offer good performance while handling dialogues in a movie or playing music that is not too bass-heavy.

The remote is a premium piece of hardware and has hotkeys for Netflix, Prime Video and YouTube along with playback controls. Overall, the remote is well built, functional and works well.

DISPLAY AND PICTURE QUALITY

Sony's X75K series of TVs are available in multiple panel sizes, starting from 43-inch and going all the way up to 75K inch. Our review unit came with a 55-inch Direct LED panel and is powered by Sony's flagship 4K X1 processor. There's no local dimming though, with the TV offering frame dimming instead. While this does help improve the visual experience in some cases though, especially in darker scenes, the use of this technology dampens the visual experience a little. Apart from this, you also have

Price
₹99,990

skin tones, and also loss of detail in the frame. Yet, the Sony X75K manages to cover for these failings with its impressive core hardware which

ensures that for the average buyer the TV performs as it should, providing a lag-free, and mostly premium TV viewing experience for watching native 4K or upscaled 4K content.

VERDICT

So, on to the most important question: Should you buy the Sony X75K? Well, it depends on what you are looking for from your next smart TV. The X75K is a premium-segment device, one that definitely looks the part. So, if you are in the market for a

TV that can elevate the look of your living room, then this could be the TV for you. It also offers good SDR and HDR performance, for the most part, making it a decent option for consuming multimedia content on it. However, when it comes to the premium segment, decent is not good enough. At this price point, you can also snag yourself the 55-inch variant of the A1, which is the entry-level OLED TV from LG. Most of the alternatives including the TV from LG offer better picture quality than the Sony X75K.

proprietary technology such as 4K X-Reality PRO, Live Colour Technology and Dynamic Contrast Enhancer. All these technologies come together to create immersive visual experiences, that for the most part are fitting for a premium segment TV. While there is no support for Dolby Vision or even HDR10+, we did get good results playing HDR10 mastered content.

However, the panel on this premium-segment television did not handle some colours as we had expected, and scenes offering wide contrast in colours exposed how the TV fails to compete with more advanced OLED panel TVs – some of which are retailing at a similar price point as the Sony X75K.

During testing, we found the TV was under saturating hues of blue and red. This impacts the overall colour accuracy of the content being played on screen, something corroborated by the results of the Calman testing of the panel. In the ColorChecker Analysis, the Sony X75K threw up an average deltaE of 6.8, with the maximum deltaE going up to 10.6.

Our biggest gripe with the Sony X75K's panel is that it does not do low-light scenes very well. There is noticeable blooming, which again leads to inaccurately represented
