ASUS Zenbook 14X Space Edition

A lean, mean, OLED powerhouse

Some products are simply designed to stand apart and the ASUS Zenbook 14X Space Edition is one such example. The laptop is beautifully crafted using a metal chassis and has one of the best laptop designs we've ever seen. Even in terms of performance, the laptop packs in a top-spec Intel processor that's able to cut through almost every type of workload. Let's find out how it performed in our testing.

Price
₹169,990

DISPLAY PERFORMANCE

The display on the ASUS Zenbook 14X Space Edition is a 14-inch OLED panel in a 16:10 aspect ratio format. In our test, we found that the OLED panel has a peak brightness of 367nits, which is very good. The screen also has a 2.8K peak resolution, which makes everything you look at highly crisp and clear.

Furthermore, the ASUS Zenbook 14X has a highly colour-accurate display. During the Calman colour checker analysis, we found that the average delta E was around 2.8, which is a very good score. It has no bleeding issues and provides an immersive viewing experience overall.

PERFORMANCE

This laptop is powered by the latest Intel 12th Gen Core i9-12900H, a 14-core monster CPU based on Intel's 7nm process. It features 6-performance cores and 8-efficiency cores. The performance cores have a maximum clock speed of 5GHz and the efficiency cores have a clock speed of 3.80GHz.

The higher core count delivers a huge boost to the laptop's multicore performance. The laptop's Cinebench R23 multicore score is around 14,000, which is closer to several high-end 17-inch gaming laptops. The chip's single-core score is very impressive at 1760. The Cinebench R20 score of the laptop is also pretty high at 5379.

In terms of GPU benchmarks, the Intel Iris Xe integrated graphics chip performs decently. However, not having a dedicated GPU in this machine is a missed opportunity given that this laptop has an OLED display which could make use of better graphics.

During our testing, the surface temperature spiked up to 41 degrees when the reviewer used the laptop while keeping it on his lap. The device's back surface got pretty hot too. However, relative to some other thin and light laptops, like the Samsung Book 2 Pro, the surface temperature on this one is fairly maintained.

In terms of battery usage, the laptop scored around 5 hours of battery life during the PC Mark 10 battery life test. The Core i9 combined with the super-bright display probably drains most of this laptop's battery.

DESIGN, KEYBOARD, AND TRACKPAD

The chassis of the ASUS Zenbook 14X Space Edition is manufactured using an aluminium alloy with a Zero-G titanium finish. No part of the laptop's hinge, deck area, keyboard, or the rest of the chassis has any flex. Everything on the laptop felt solid

and built to last. The laptop's audio quality deserves a quick note here as well because the downward-facing speakers are loud and decently crisp. In addition to the toughness, the Zenbook 14X also features space-themed engravings and an amazing 3.5-inch OLED ZenDisplay on the laptop's back panel. The additional display can show space-themed animations or any other custom message as well.

Moving on to the laptop's keyboard, its keys have a 19.05 mm key pitch and a 1.4mm key travel which is high for laptops and may make for a great typing experience for some. The trackpad on this laptop is also good. It is a single-piece pad and has no dedicated left or right button.

VERDICT

The ASUS Zenbook 14X Space Edition is a very premium thin and light laptop, which comes equipped with an Intel 12th Gen Core i9-12900H processor. In terms of capabilities it is a highly capable laptop and also offers an immersive experience thanks to an OLED display. In terms of looks as well, the machine stands apart and offers an excellent overall build quality as well.
