Google Analytics deemed illegal in Italy

After careful deliberation, the Italian Data Protection Authority - Garante - has reached the conclusion that Google Analytics violates GDPR law. The news comes just one week after CNIL, the French Data Protection Agency, published guidelines regarding Google Analytics and banned Google Analytics earlier this year. Italy is the third country after France and Austria to arrive at the same conclusion. The crux of the

matter lies with the transfer of personal data from the EU to the United States when Google Analytics is used on a web property. U.S. companies such as Google are required by law to disclose any information should U.S. intelligence agencies make such a request and since EU citizens' right to data privacy is protected by GDPR, this would be in direct violation of GDPR. Garante stated that any information that is personally identifiable, including IP addresses if processed by Google,

results in the transfer of personal data to the U.S. And since Google has several alternative sources of data, even anonymised data can be enriched and made identifiable should Google choose to do so. Google Analytics is currently in the process of moving

to GA4, the next evolution of the platform which claims to anonymise IP addresses. Even this would be considered a violation of GDPR.

Stack Overflow Developer Survey 2022 out

About 30 per cent of all respondents of the survey spend an average of 30-60 minutes a day answering questions on the platform, as per this year's survey. The annual survey conducted by one of the most popular Q&A platforms for developers has some interesting insights to reveal. Folks learning to code has increased by 60-70 per cent year-on-year. The pandemic did provide a massive push on e-Learning and it seems as if the trend continues to be that way. Another winner was Docker which saw greater adoption from developers and saw a rise from 55 per cent to 69 per cent this year. A lot of 3D libraries also saw an uptick in light of the Metaverse hype.

For the seventh year in a row, Rust has retained the crown as the most loved language among developers. As for web frameworks, Phoenix has

overtaken Svelte to be the most loved amongst them all. Aside from free and open-source tools and frameworks, there was also an uptick across paid platforms and languages. Clojure, for example, continues to remain the highest-paid language. And for the most interesting and obvious statistic of them all, a whopping 85 per cent of the developers said that their organisations are at least partially remote and the larger organisations seem to be leading the charge whereas smaller organisations were more likely to return to in-person operations sooner. >

AMD adds FSR 2.0 to GPUOpen

FidelityFX Super Resolution, AMD's temporal upscaling solution has been open-sourced and added to their GPUOpen library with full documentation. FSR offers similar of better image quality and even includes high-quality anti-aliasing that can easily replace any TAA within the game frame. There is no requirement for Machine Learning hardware for implementing FSR 2.0, so the upscaling technology becomes a lot more accessible and easier to implement. FSR 2.0 requires depth, colour and velocity buffers to be provided at render resolution with an optional reactive mask and exposure data. This can

be used to create the output frames. AMD FSR 2 has seen wide adoption from game developers with studios such as IOInteractive, Gearbox, Obsidian, Respawn Entertainment being some of the early adopters of the technology.
