

Gyazo

Taking screenshots made simple

Satvik Pandey | satvik@digit.in

Taking screenshots and sharing them can be a hassle. The multiple steps that you must go through to take a screenshot, save it, and upload it to a sharing service to distribute it to an audience, can be a tiring process. Gyazo, however, provides a solution to this problem. The

When you click download, the install file will show up on your computer. Install the file and the remainder of the process is quite intuitive. A few clicks through the install menu, and you will be in.

Gyazo is also available as a web browser extension for Mozilla Firefox, Google Chrome, and Microsoft Edge. A mobile version of the app is available on the Google Play Store and the Apple App Store. However, in this article, we will primarily focus on the app's desktop version.

app lets users take one-click screenshots without going through other tedious steps. In this article, we will run you through the app's basic functionality so you know how to navigate the waters when using the application. Before we move on, here's a fun fact about the name of the app. The name "Gyazo" is a pun on the Japanese word for "image", which is *gazō*.

Note: The software was tested on a MacBook Air (2020), running MacOS Monterey v12.3.1. For Windows users, there might be some differences in the in-app navigation.

SETTING UP AND GETTING STARTED

One of the best parts of Gyazo is that it does not have an extensive setup process. To install the software, go to Gyazo's official website gyazo.com. The website, in most cases, will detect your computer's operating system automatically.

Once you have the app installed, fire it up, and you will be presented with a crosshair, using which you can mark the area you want to capture. Select the area while pressing down on the left mouse button. When you leave the left mouse button, a new tab will open in your browser with the

screenshot ready to be saved to your system or shared.

SHARING

There are multiple different sharing options available on Gyazo. The first and most basic step is to just take the URL generated for your screenshot and send it to the desired recipient. The identifier string for each screenshot is different and uniquely-generated. This means that it would be very difficult for any unwanted individual to guess the exact URL of your screenshot. It would make the sharing secure enough for most users. However, if you want added security while sharing your screenshots, other features are available.

Apart from the regular direct social media sharing, available right from the page where your screenshot is displayed, there is also an option that would let you copy the HTML code of the screenshot. If you are a Gyazo Pro user, then you also get the option to lock your screenshot using a password. The app also allows users to choose whether the recipient of their image can see the metadata of the one that they are sharing or not.

To add a password to an image, just open the image or the media file, and from the top-right menu bar, click on the icon represented using the lock symbol. Enter a password of your choice and click the blue 'lock now' button. Similarly, if you want to hide the metadata of your screengrab, then after opening the image, scroll down to the description and click on the button labelled 'Image metadata visible'. By default, the selected option enables the recipient to see the metadata. However, it can be changed by selecting the other option from the dropdown menu.

In case you work in a collaborative environment, Gyazo also packs a team feature that comes "with enhanced security and easy admin controls". This lets you share screenshots and GIFs created using Gyazo with a team which you can moderate. According to the features page on the official website, this feature lets users add instant visual sharing in messages and other forms of tex-
