

One Good Ring

Funding: US\$ 15,343 pledged out of US\$5041

Link: <https://dgit.in/onegoodring>

While Sauron and the rest of Middle Earth are losing our minds over the One Ring, we are losing our minds over the One Good Ring. What is the One Good Ring, you ask? Is it a new ring forged to take on the ring of power? Well, sadly, no. Then again, what the One Good Ring does is nothing short of magical. The Ring is actually a pretty simple piece of kit. It has a built-in wireless chip that communicates with any NFC-enabled smartphone. It is made from a ceramic material and has a sleek

and modern aesthetic. It is also pretty durable and waterproof. One of its best features is that it does not need to be charged. Moving on its function, think of the Ring as a medium to share information. For example, you can

feed the Ring with all of your social media handles. If you want to share those handles with someone, you simply have to tap the ring on their NFC-enabled smartphone. You can also do the same with your resume, your professional portfolio and even your contact details. You can also programme the ring to make your own life easier by programming it with tasks you tend to perform a lot on your smartphone like let's say going to certain websites. If it sounds interesting, you can pledge US\$ 51 to get your hands on the One Good Ring.

Revopoint MINI

Funding: US\$ 2,47,240 pledged out of US\$12,740

Link: <https://dgit.in/revopointmini>

3D modelling is one tough nut to crack. One of the most cumbersome aspects is to recreate real, physical models into virtual ones. Currently, large and cumbersome 3D scanners are used for this but a better solution might be here. The new Revopoint MINI might be the answer for most people starting out in the 3D modelling industry thanks to its diminutive size and low barrier to entry. The compact size and reasonable asking price, however, do not mean a sub-standard product as the Revopoint MINI is precise up to 0.02mm. Revopoint also claims to be the world's first affordable high-precision blue light scanner. A few use cases where the MINI excels include reverse engineering of parts for spares or design improvements, creating 3D renders of extinct animals by scanning fossils, jewellery designing, medical applications especially in dentistry, 3D animation and modelling, and, of course, for quality control of fabricated parts. The MINI works thanks to the use of binocular blue light technology that projects high-resolution structured light. That light is then picked up by the high-resolution dual-camera system. An intelligent algorithm uses that data and creates a precise and detailed 3D data structure. You can get your hands on the Revopoint MINI for about US\$ 436 under the Early Bird MINI Standard Pledge.

SunnySide: Solar Powered Self Heating/Cooling Lunchbox

Funding: US\$ 74,960 pledged out of US\$10,000

Link: <https://dgit.in/sunnyside>

While microwaving has been a simple enough solution to getting yourself a nice hot lunch, it is still somewhat of a task, especially when you're on the go. Think about it, wouldn't you be more inclined to eat healthy if you didn't have to get up from your desk, unpack your lunch, go all the way to wherever the microwave is and wait what seems like an eternity for it to go beep beep beep? Thankfully, for the uber lazy among us, the SunnySide lunch box on Kickstarter might be just what we

need. So, Sunny Side is a self-heating, self-cooling lunch box with a built-in 10,000mAh battery which can be charged using the sun or your wall outlet. Oh, and it also acts as a power bank so

you can charge other devices using your lunchbox battery. Now, that's a sentence you probably never thought you'd read. It also has a built-in thermometer to monitor the temperature along with an induction coil inside it that can heat the food up to 75-degrees C. To keep whatever is inside the box cool, SunnySide also has thick insulation, a cooling element and 3 fans so you can probably say goodbye to warm and soggy salads. You can get yourself a SunnySide lunchbox by pledging US\$ 69 to their Kickstarter. Admit it, you haven't been this excited about a lunchbox since you were back in school, right?
