

DON'T DO IT. JUST DON'T.

Prepare for the money crunch –
the geek way.

Satvik Pandey | satvik@digit.in

would be a sheer injustice to the efforts of the numerous financial experts who have been spending

aying anything about the impending recession with a level of understanding that we have

countless hours studying its effects on our lives. Instead, we're focussing on the buying of tech aspect, and trying to give you the best possible advice we can, in order to make your life pain free. And we get it, we're geeks who love to buy the latest and best in tech too, often going way beyond our budgets to try and get the best possible quality from our

products. The global chip shortage is resolving and that upgrade you've wanted for ages is finally becoming affordable again, but is it imperative? That's what you need to ask yourself.

A good rule of thumb (even without a looming recession) is to evaluate your life *without* something. What if you don't buy that new gadget, how negatively will it impact your life? Sure, there are some things that will be needed, because they will aid work, or study, and without them you will indeed suffer. A new college kid might really need a laptop that is capable of running certain software that make up part of their curriculum over the next 2 years, however does that laptop also need to run the latest games? We're going to have more of that kind of advice in this article, so buckle up!

RISKY OR FRIVOLOUS INVESTMENTS? NO THANK YOU

At a time when it is hard for the best brains on the planet to predict where the financial situation of the world markets is headed, we should be the last ones making risky investments. The crypto market also just tanked, and many who were betting big on it are very down indeed. Even smart people who only play with disposable income, don't realise how fast disposable income can become indispensable! One might have amount X in crypto, even capped at that, because you're playing the game like a bear not a bull, and looking at it like a long term investment. However, circumstances change, and if you lost your job, or something like that, you might need to extract X from the crypto markets to pay your bills, only to see that it's value is X/10 now. Just make sure disposable income is actually disposable, that's all, and not something you're hoping to use later.
