

THIS IS TECHNOLOGY, CULTURE AND SCIENCE WITH A DIFFERENCE, AND THAT DIFFERENCE IS USUALLY ENOUGH TO MAKE MOST NORMAL PEOPLE GO "WTF?"

This month in ALT:

We explore some of the most famous and iconic equations that have shaped our understanding of the world, we look at some of the most drool-worthy tech money can buy and check out a mini projector that packs a huge punch.

Voices of loved ones on Alexa!

While it may seem quite creepy at first glance, Alexa's new feature (that is still being worked on) allows users to recreate the voices of their loved ones using just a minute to train the chatbot. It can even be used to recreate the voice of a dead relative. <https://dgit.in/alexa-voice>

WHAT'S NEW

Not Another Data Privacy Violation!

Mega is a cloud storage platform with 250 million users and 120 billion files totaling more than 1,000 petabytes of storage space. The unusual claim that none of Mega's top-tier rivals make—that not even Mega can decode the data it stores—has been a crucial selling feature. However, the architecture that Mega uses to encrypt files, is rife with fundamental cryptographic weaknesses that make it simple for anyone in charge of the platform to launch a full key recovery attack on users after they have logged in a sufficient number of times.

Mega just started releasing an update that makes it more difficult to carry out the attacks after secretly receiving the researchers' findings in March. The patch, however, only offers a "ad hoc" method of preventing the researchers' key-recovery attack. Key reuse, a lack of integrity checks, and other systemic concerns that they observed are not resolved by the patch.

by the patch. <https://dgit.in/MegaDataBreach>

Raptor Lake CPUs to support DDR4 memory

It has come to the attention of the keen-eyed folks at Videocardz that the upcoming Intel 13th Gen processors – codenamed Raptor Lake – will be backwards compatible with DDR4 memory. Based on the same architecture as Alder Lake, these CPUs are set to launch later this year. This news comes on the back of the leaked listings that suggested that DDR4

supporting motherboards from ASRock are under development. After this, everyone is curious to see what benefits Intel brings to make a case for the latest gen

motherboards. On team Red, there are no signs of backwards RAM compatibility. The latest-gen AMD motherboards and CPUs, from what is known so far, will come with support for only DDR5 memory. Now, it will be interesting to see if Intel is able to gain back the market share it had lost to AMD in the last few years.

Working in the Metaverse is Counterintuitive

According to a recent study published on arXiv, working in the metaverse for a lengthy period of time might cause higher levels of anxiety, the sense of increased workloads, and even negative physical impacts for some individuals. <https://dgit.in/MetaWorse>

Tesla Denies Workers Pay, Results in Lawsuit

Former Tesla workers have filed a complaint against the firm, claiming that because the corporation failed to give prior notice of the job losses, the decision to conduct a "mass layoff" was illegal under federal law. <https://dgit.in/teslawsuit>

Tech Giants Form the "Metaverse Standards Forum"

The Metaverse Standards Forum intends to promote open interoperability, making it simpler for devs to create across platforms. Major companies like Meta, Microsoft, Epic Games, Adobe, NVIDIA, Sony, Unity, and others are already members. <https://dgit.in/metaversestandardsforum>
